#### 1.1 OSAL Introduction

The goal of this library is to promote the creation of portable and reusable real time embedded system software. Given the necessary OS abstraction layer implementations, the same embedded software should compile and run on a number of platforms ranging from spacecraft computer systems to desktop PCs.

The OS Application Program Interfaces (APIs) are broken up into core, file system, loader, network, and timer APIs. See the related document sections for full descriptions.

Note

The majority of these APIs should be called from a task running in the context of an OSAL application and in general should not be called from an ISR. There are a few exceptions, such as the ability to give a binary semaphore from an ISR.

## 1.2 File System Overview

The File System API is a thin wrapper around a selection of POSIX file APIs. In addition the File System API presents a common directory structure and volume view regardless of the underlying system type. For example, vxWorks uses MS-DOS style volume names and directories where a vxWorks RAM disk might have the volume "RAM:0". With this File System API, volumes are represented as Unix-style paths where each volume is mounted on the root file system:

- RAM:0/file1.dat becomes /mnt/ram/file1.dat
- FL:0/file2.dat becomes /mnt/fl/file2.dat

This abstraction allows the applications to use the same paths regardless of the implementation and it also allows file systems to be simulated on a desktop system for testing. On a desktop Linux system, the file system abstraction can be set up to map virtual devices to a regular directory. This is accomplished through the OS\_mkfs call, OS\_mount call, and a BSP specific volume table that maps the virtual devices to real devices or underlying file systems.

In order to make this file system volume abstraction work, a "Volume Table" needs to be provided in the Board Support Package of the application. The table has the following fields:

- Device Name: This is the name of the virtual device that the Application uses. Common names are "ramdisk1", "flash1", or "volatile1" etc. But the name can be any unique string.
- Physical Device Name: This is an implementation specific field. For vxWorks it is not needed and can be left blank. For a File system based implementation, it is the "mount point" on the root file system where all of the volume will be mounted. A common place for this on Linux could be a user's home directory, "/tmp", or even the current working directory ".". In the example of "/tmp" all of the directories created for the volumes would be under "/tmp" on the Linux file system. For a real disk device in Linux, such as a RAM disk, this field is the device name "/dev/ram0".
- Volume Type: This field defines the type of volume. The types are: FS\_BASED which uses the existing file system, RAM\_DISK which uses a RAM\_DISK device in vxWorks, RTEMS, or Linux, FLASH\_DISK\_FORMAT which uses a flash disk that is to be formatted before use, FLASH\_DISK\_INIT which uses a flash disk with an existing format that is just to be initialized before it's use, EEPROM which is for an EEPROM or PROM based system.
- Volatile Flag: This flag indicates that the volume or disk is a volatile disk (RAM disk) or a non-volatile disk, that retains its contents when the system is rebooted. This should be set to TRUE or FALSE.
- Free Flag: This is an internal flag that should be set to FALSE or zero.
- Is Mounted Flag: This is an internal flag that should be set to FALSE or zero. Note that a "pre-mounted" FS\_B

  ASED path can be set up by setting this flag to one.
- · Volume Name: This is an internal field and should be set to a space character " ".
- · Mount Point Field: This is an internal field and should be set to a space character " ".
- Block Size Field: This is used to record the block size of the device and does not need to be set by the user.

## 1.3 File Descriptors In Osal

The OSAL uses abstracted file descriptors. This means that the file descriptors passed back from the OS\_open and OS creat calls will only work with other OSAL OS \* calls. The reasoning for this is as follows:

Because the OSAL now keeps track of all file descriptors, OSAL specific information can be associated with a specific file descriptor in an OS independent way. For instance, the path of the file that the file descriptor points to can be easily retrieved. Also, the OSAL task ID of the task that opened the file can also be retrieved easily. Both of these pieces of information are very useful when trying to determine statistics for a task, or the entire system. This information can all be retrieved with a single API, OS FDGetInfo.

All of the possible file system calls are not implemented. "Special" files requiring OS specific control/operations are by nature not portable. Abstraction in this case is not possible, so the raw OS calls should be used (including open/close/etc). Mixing with OSAL calls is not supported for such cases. OS\_TranslatePath is available to support using open directly by an app and maintain abstraction on the file system.

There are some small drawbacks with the OSAL file descriptors. Because the related information is kept in a table, there is a define called OS\_MAX\_NUM\_OPEN\_FILES that defines the maximum number of file descriptors available. This is a configuration parameter, and can be changed to fit your needs.

Also, if you open or create a file not using the OSAL calls (OS\_open or OS\_creat) then none of the other OS\_\* calls that accept a file descriptor as a parameter will work (the results of doing so are undefined). Therefore, if you open a file with the underlying OS's open call, you must continue to use the OS's calls until you close the file descriptor. Be aware that by doing this your software may no longer be OS agnostic.

1.4 Timer Overview 5

## 1.4 Timer Overview

The timer API is a generic interface to the OS timer facilities. It is implemented using the POSIX timers on Linux and vxWorks and the native timer API on RTEMS. The number of timers supported is controlled by the configuration parameter OS\_MAX\_TIMERS.

## 2 Module Index

## 2.1 Modules

Here is a list of all modules:

OSAL Semaphore State Defines	8
OSAL Binary Semaphore APIs	10
OSAL BSP low level access APIs	16

## 5 Module Documentation

## 5.1 OSAL Semaphore State Defines

## Macros

- #define OS\_SEM\_FULL 1
  Semaphore full state.
- #define OS\_SEM\_EMPTY 0
  Semaphore empty state.

## 5.1.1 Detailed Description

## 5.1.2 Macro Definition Documentation

## **5.1.2.1 OS\_SEM\_EMPTY** #define OS\_SEM\_EMPTY 0

Semaphore empty state.

Definition at line 35 of file osapi-binsem.h.

## $\textbf{5.1.2.2} \quad \textbf{OS\_SEM\_FULL} \quad \texttt{\#define OS\_SEM\_FULL} \quad 1$

Semaphore full state.

Definition at line 34 of file osapi-binsem.h.

## 5.2 OSAL Binary Semaphore APIs

#### **Functions**

• int32 OS\_BinSemCreate (osal\_id\_t \*sem\_id, const char \*sem\_name, uint32 sem\_initial\_value, uint32 options)

Creates a binary semaphore.

int32 OS\_BinSemFlush (osal\_id\_t sem\_id)

Unblock all tasks pending on the specified semaphore.

int32 OS\_BinSemGive (osal\_id\_t sem\_id)

Increment the semaphore value.

int32 OS\_BinSemTake (osal\_id\_t sem\_id)

Decrement the semaphore value.

• int32 OS\_BinSemTimedWait (osal\_id\_t sem\_id, uint32 msecs)

Decrement the semaphore value with a timeout.

int32 OS\_BinSemDelete (osal\_id\_t sem\_id)

Deletes the specified Binary Semaphore.

• int32 OS\_BinSemGetIdByName (osal\_id\_t \*sem\_id, const char \*sem\_name)

Find an existing semaphore ID by name.

• int32 OS\_BinSemGetInfo (osal\_id\_t sem\_id, OS\_bin\_sem\_prop\_t \*bin\_prop)

Fill a property object buffer with details regarding the resource.

## 5.2.1 Detailed Description

#### 5.2.2 Function Documentation

Creates a binary semaphore.

Creates a binary semaphore with initial value specified by sem\_initial\_value and name specified by sem\_name. sem\_id will be returned to the caller

#### **Parameters**

out	sem_id	will be set to the non-zero ID of the newly-created resource (must not be null)
in	sem_name	the name of the new resource to create (must not be null)
in	sem_initial_value	the initial value of the binary semaphore
in	options	Reserved for future use, should be passed as 0.

#### Returns

Execution status, see OSAL Return Code Defines

#### **Return values**

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if sen name or sem_id are NULL
OS_ERR_NAME_TOO_LONG	name length including null terminator greater than OS_MAX_API_NAME
OS_ERR_NO_FREE_IDS	if all of the semaphore ids are taken
OS_ERR_NAME_TAKEN	if this is already the name of a binary semaphore
OS_SEM_FAILURE	if the OS call failed (return value only verified in coverage test)

## 

Deletes the specified Binary Semaphore.

This is the function used to delete a binary semaphore in the operating system. This also frees the respective sem\_id to be used again when another semaphore is created.

#### **Parameters**

in	sem←	The object ID to delete
	_id	

#### Returns

Execution status, see OSAL Return Code Defines

#### **Return values**

OS_SUCCESS	Successful execution.	
OS_ERR_INVALID_ID	if the id passed in is not a valid binary semaphore	
OS_SEM_FAILURE	if an unspecified failure occurs (return value only verified in coverage test)	

# **5.2.2.3 OS\_BinSemFlush()** int32 OS\_BinSemFlush ( osal\_id\_t sem\_id )

Unblock all tasks pending on the specified semaphore.

The function unblocks all tasks pending on the specified semaphore. However, this function does not change the state of the semaphore.

in	sem←	The object ID to operate on
	_id	

## Returns

Execution status, see OSAL Return Code Defines

## Return values

OS_SUCCESS	Successful execution.	
OS_ERR_INVALID_ID	if the id passed in is not a binary semaphore	
OS_SEM_FAILURE	if an unspecified failure occurs (return value only verified in coverage test)	

## 

Find an existing semaphore ID by name.

This function tries to find a binary sem Id given the name of a bin\_sem The id is returned through sem\_id

#### **Parameters**

out	sem_id	will be set to the ID of the existing resource
in	sem_name	the name of the existing resource to find (must not be null)

#### Returns

Execution status, see OSAL Return Code Defines

## Return values

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	is semid or sem_name are NULL pointers
OS_ERR_NAME_TOO_LONG	name length including null terminator greater than OS_MAX_API_NAME
OS_ERR_NAME_NOT_FOUND	if the name was not found in the table

## **5.2.2.5 OS\_BinSemGetInfo()** int32 OS\_BinSemGetInfo (

```
osal_id_t sem_id,
OS_bin_sem_prop_t * bin_prop )
```

Fill a property object buffer with details regarding the resource.

This function will pass back a pointer to structure that contains all of the relevant info( name and creator) about the specified binary semaphore.

#### **Parameters**

in	sem_id	The object ID to operate on
out	bin_prop	The property object buffer to fill (must not be null)

#### Returns

Execution status, see OSAL Return Code Defines

#### **Return values**

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	if the id passed in is not a valid semaphore
OS_INVALID_POINTER	if the bin_prop pointer is null

# **5.2.2.6 OS\_BinSemGive()** int32 OS\_BinSemGive ( osal\_id\_t sem\_id )

Increment the semaphore value.

The function unlocks the semaphore referenced by sem\_id by performing a semaphore unlock operation on that semaphore. If the semaphore value resulting from this operation is positive, then no threads were blocked waiting for the semaphore to become unlocked; the semaphore value is simply incremented for this semaphore.

#### **Parameters**

in	sem←	The object ID to operate on
	_id	

#### Returns

Execution status, see OSAL Return Code Defines

## Return values

OS_SUCCESS	Successful execution.	
OS_ERR_INVALID_ID	if the id passed in is not a binary semaphore	
OS_SEM_FAILURE	if an unspecified failure occurs (return value only verified in coverage test)	

```
5.2.2.7 OS_BinSemTake() int32 OS_BinSemTake ( osal_id_t sem_id )
```

Decrement the semaphore value.

The locks the semaphore referenced by sem\_id by performing a semaphore lock operation on that semaphore. If the semaphore value is currently zero, then the calling thread shall not return from the call until it either locks the semaphore or the call is interrupted.

#### **Parameters**

in	sem←	The object ID to operate on
	_id	

#### Returns

Execution status, see OSAL Return Code Defines

#### **Return values**

OS_SUCCESS	Successful execution.	
OS_ERR_INVALID_ID	the Id passed in is not a valid binary semaphore	
OS_SEM_FAILURE	if an unspecified failure occurs (return value only verified in coverage test)	

```
5.2.2.8 OS_BinSemTimedWait() int32 OS_BinSemTimedWait ( osal_id_t sem_id, uint32 msecs )
```

Decrement the semaphore value with a timeout.

The function locks the semaphore referenced by sem\_id. However, if the semaphore cannot be locked without waiting for another process or thread to unlock the semaphore, this wait shall be terminated when the specified timeout, msecs, expires.

#### **Parameters**

in	sem⊷ _id	The object ID to operate on
in	msecs	The maximum amount of time to block, in milliseconds

#### Returns

Execution status, see OSAL Return Code Defines

#### Return values

OS_SUCCESS	Successful execution.
OS_SEM_TIMEOUT	if semaphore was not relinquished in time
OS_ERR_INVALID_ID	if the ID passed in is not a valid semaphore ID
OS_SEM_FAILURE	if an unspecified failure occurs (return value only verified in coverage test)

#### 5.3 OSAL BSP low level access APIs

These are for OSAL internal BSP information access to pass any BSP-specific boot/command line/startup arguments through to the application, and return a status code back to the OS after exit.

#### **Functions**

- void OS BSP SetResourceTypeConfig (uint32 ResourceType, uint32 ConfigOptionValue)
- uint32 OS\_BSP\_GetResourceTypeConfig (uint32 ResourceType)
- uint32 OS\_BSP\_GetArgC (void)
- char \*const \* OS\_BSP\_GetArgV (void)
- void OS\_BSP\_SetExitCode (int32 code)

#### 5.3.1 Detailed Description

These are for OSAL internal BSP information access to pass any BSP-specific boot/command line/startup arguments through to the application, and return a status code back to the OS after exit.

Not intended for user application use

#### 5.3.2 Function Documentation

#### 5.4 OSAL Real Time Clock APIs

#### **Functions**

```
    int32 OS_GetLocalTime (OS_time_t *time_struct)
```

Get the local time.

int32 OS\_SetLocalTime (const OS\_time\_t \*time\_struct)

Set the local time.

static int64 OS TimeGetTotalSeconds (OS time t tm)

Get interval from an OS\_time\_t object normalized to whole number of seconds.

static OS time t OS TimeFromTotalSeconds (int64 tm)

Get an OS\_time\_t interval object from an integer number of seconds.

static int64 OS\_TimeGetTotalMilliseconds (OS\_time\_t tm)

Get interval from an OS\_time\_t object normalized to millisecond units.

• static OS\_time\_t OS\_TimeFromTotalMilliseconds (int64 tm)

Get an OS\_time\_t interval object from a integer number of milliseconds.

static int64 OS TimeGetTotalMicroseconds (OS time t tm)

Get interval from an OS\_time\_t object normalized to microsecond units.

static OS\_time\_t OS\_TimeFromTotalMicroseconds (int64 tm)

Get an OS\_time\_t interval object from a integer number of microseconds.

static int64 OS\_TimeGetTotalNanoseconds (OS\_time\_t tm)

Get interval from an OS\_time\_t object normalized to nanosecond units.

static OS time t OS TimeFromTotalNanoseconds (int64 tm)

Get an OS time t interval object from a integer number of nanoseconds.

static int64 OS\_TimeGetFractionalPart (OS\_time\_t tm)

Get subseconds portion (fractional part only) from an OS\_time\_t object.

static uint32 OS\_TimeGetSubsecondsPart (OS\_time\_t tm)

Get 32-bit normalized subseconds (fractional part only) from an OS\_time\_t object.

• static uint32 OS\_TimeGetMillisecondsPart (OS\_time\_t tm)

Get milliseconds portion (fractional part only) from an OS\_time\_t object.

static uint32 OS\_TimeGetMicrosecondsPart (OS\_time\_t tm)

Get microseconds portion (fractional part only) from an OS\_time\_t object.

static uint32 OS TimeGetNanosecondsPart (OS time t tm)

Get nanoseconds portion (fractional part only) from an OS time t object.

static OS\_time\_t OS\_TimeAssembleFromNanoseconds (int64 seconds, uint32 nanoseconds)

Assemble/Convert a number of seconds + nanoseconds into an OS\_time\_t interval.

static OS\_time\_t OS\_TimeAssembleFromMicroseconds (int64 seconds, uint32 microseconds)

Assemble/Convert a number of seconds + microseconds into an OS\_time\_t interval.

static OS\_time\_t OS\_TimeAssembleFromMilliseconds (int64 seconds, uint32 milliseconds)

Assemble/Convert a number of seconds + milliseconds into an OS\_time\_t interval.

static OS time t OS TimeAssembleFromSubseconds (int64 seconds, uint32 subseconds)

Assemble/Convert a number of seconds + subseconds into an OS\_time\_t interval.

static OS time t OS TimeAdd (OS time t time1, OS time t time2)

Computes the sum of two time intervals.

static OS\_time\_t OS\_TimeSubtract (OS\_time\_t time1, OS\_time\_t time2)

Computes the difference between two time intervals.

## 5.4.1 Detailed Description

#### 5.4.2 Function Documentation

```
5.4.2.1 OS_GetLocalTime() int32 OS_GetLocalTime ( OS_time_t * time_struct )
```

Get the local time.

This function gets the local time from the underlying OS.

Note

Mission time management typically uses the cFE Time Service

## **Parameters**

out	time_struct	An OS_time_t that will be set to the current time (must not be null)
-----	-------------	--

#### Returns

Get local time status, see OSAL Return Code Defines

## Return values

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if time_struct is null

```
5.4.2.2 OS_SetLocalTime() int32 OS_SetLocalTime ( const OS_time_t * time_struct )
```

Set the local time.

This function sets the local time on the underlying OS.

Note

Mission time management typically uses the cFE Time Services

I	in	time_struct	An OS_time_	t containing the current time (must not be null)	1
---	----	-------------	-------------	--	---

#### Returns

Set local time status, see OSAL Return Code Defines

#### Return values

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if time_struct is null

Computes the sum of two time intervals.

#### **Parameters**

in	time1	The first interval
in	time2	The second interval

#### Returns

The sum of the two intervals (time1 + time2)

Definition at line 467 of file osapi-clock.h.

References OS time t::ticks.

```
5.4.2.4 OS_TimeAssembleFromMicroseconds() static OS_time_t OS_TimeAssembleFromMicroseconds ( int64 seconds, uint32 microseconds ) [inline], [static]
```

Assemble/Convert a number of seconds + microseconds into an OS\_time\_t interval.

This creates an OS\_time\_t value using a whole number of seconds and a fractional part in units of microseconds. This is the inverse of OS\_TimeGetTotalSeconds() and OS\_TimeGetMicrosecondsPart(), and should recreate the original OS\_time\_t value from these separate values (aside from any potential conversion losses due to limited resolution of the data types/units).

#### See also

OS\_TimeGetTotalSeconds(), OS\_TimeGetMicrosecondsPart()

in	seconds	Whole number of seconds
in	microseconds	Number of microseconds (fractional part only)

#### Returns

The input arguments represented as an OS\_time\_t interval

Definition at line 402 of file osapi-clock.h.

References OS\_TIME\_TICKS\_PER\_SECOND, OS\_TIME\_TICKS\_PER\_USEC, and OS\_time\_t::ticks.

```
5.4.2.5 OS_TimeAssembleFromMilliseconds() static OS_time_t OS_TimeAssembleFromMilliseconds ( int64 seconds, uint32 milliseconds ) [inline], [static]
```

Assemble/Convert a number of seconds + milliseconds into an OS time t interval.

This creates an OS\_time\_t value using a whole number of seconds and a fractional part in units of milliseconds. This is the inverse of OS\_TimeGetTotalSeconds() and OS\_TimeGetMillisecondsPart(), and should recreate the original OS\_time\_t value from these separate values (aside from any potential conversion losses due to limited resolution of the data types/units).

#### See also

OS TimeGetTotalSeconds(), OS TimeGetMillisecondsPart()

#### **Parameters**

in	seconds	Whole number of seconds
in	milliseconds	Number of milliseconds (fractional part only)

## Returns

The input arguments represented as an OS\_time\_t interval

Definition at line 426 of file osapi-clock.h.

References OS\_TIME\_TICKS\_PER\_MSEC, OS\_TIME\_TICKS\_PER\_SECOND, and OS\_time\_t::ticks.

Assemble/Convert a number of seconds + nanoseconds into an OS time t interval.

This creates an OS\_time\_t value using a whole number of seconds and a fractional part in units of nanoseconds. This is the inverse of OS\_TimeGetTotalSeconds() and OS\_TimeGetNanosecondsPart(), and should recreate the original OS\_time\_t value from these separate values (aside from any potential conversion losses due to limited resolution of the data types/units).

#### See also

OS TimeGetTotalSeconds(), OS TimeGetNanosecondsPart()

#### **Parameters**

in	seconds	Whole number of seconds
in	nanoseconds	Number of nanoseconds (fractional part only)

#### Returns

The input arguments represented as an OS\_time\_t interval

Definition at line 378 of file osapi-clock.h.

References OS\_TIME\_TICK\_RESOLUTION\_NS, OS\_TIME\_TICKS\_PER\_SECOND, and OS\_time\_t::ticks.

Assemble/Convert a number of seconds + subseconds into an OS time t interval.

This creates an OS\_time\_t value using a whole number of seconds and a fractional part in units of sub-seconds  $(1/2^32)$ . This is the inverse of OS\_TimeGetTotalSeconds() and OS\_TimeGetSubsecondsPart(), and should recreate the original OS\_time\_t value from these separate values (aside from any potential conversion losses due to limited resolution of the data types/units).

## See also

OS TimeGetTotalSeconds(), OS TimeGetNanosecondsPart()

#### **Parameters**

in	seconds	Whole number of seconds	]
in	subseconds	Number of subseconds (32 bit fixed point fractional part)	]

#### Returns

The input arguments represented as an OS\_time\_t interval

Definition at line 449 of file osapi-clock.h.

References OS\_TIME\_TICKS\_PER\_SECOND, and OS\_time\_t::ticks.

Get an OS\_time\_t interval object from a integer number of microseconds.

This is the inverse operation of OS\_TimeGetTotalMicroseconds(), converting the total number of microseconds into an OS\_time\_t value.

#### See also

OS\_TimeGetTotalMicroseconds()

#### **Parameters**

in	tm	Time interval value, in microseconds
----	----	--------------------------------------

#### Returns

OS time t value representing the interval

Definition at line 216 of file osapi-clock.h.

References OS\_TIME\_TICKS\_PER\_USEC.

```
5.4.2.9 OS_TimeFromTotalMilliseconds() static OS_time_t OS_TimeFromTotalMilliseconds ( int64 tm ) [inline], [static]
```

Get an OS\_time\_t interval object from a integer number of milliseconds.

This is the inverse operation of OS\_TimeGetTotalMilliseconds(), converting the total number of milliseconds into an OS\_time\_t value.

#### See also

OS\_TimeGetTotalMilliseconds()

in tm Time interval value, in millise	conds
---------------------------------------	-------

#### Returns

OS\_time\_t value representing the interval

Definition at line 182 of file osapi-clock.h.

References OS\_TIME\_TICKS\_PER\_MSEC.

## 

Get an OS time t interval object from a integer number of nanoseconds.

This is the inverse operation of OS\_TimeGetTotalNanoseconds(), converting the total number of nanoseconds into an OS\_time\_t value.

#### See also

OS\_TimeGetTotalNanoseconds()

#### **Parameters**

in	tm	Time interval value, in nanoseconds
----	----	-------------------------------------

#### Returns

OS\_time\_t value representing the interval

Definition at line 254 of file osapi-clock.h.

References OS\_TIME\_TICK\_RESOLUTION\_NS.

## 

Get an OS\_time\_t interval object from an integer number of seconds.

This is the inverse operation of OS\_TimeGetTotalSeconds(), converting the total number of seconds into an OS\_time\_t value.

See also

OS TimeGetTotalSeconds()

in tm Time interval value	, in seconds
---------------------------	--------------

#### Returns

OS\_time\_t value representing the interval

Definition at line 148 of file osapi-clock.h.

References OS\_TIME\_TICKS\_PER\_SECOND.

# **5.4.2.12 OS\_TimeGetFractionalPart()** static int64 OS\_TimeGetFractionalPart ( OS\_time\_t tm ) [inline], [static]

Get subseconds portion (fractional part only) from an OS time t object.

Extracts the fractional part from a given OS\_time\_t object. Units returned are in ticks, not normalized to any standard time unit.

#### **Parameters**

in	tm	Time interval value
----	----	---------------------

#### Returns

Fractional/subsecond portion of time interval in ticks

Definition at line 270 of file osapi-clock.h.

References OS\_TIME\_TICKS\_PER\_SECOND, and OS\_time\_t::ticks.

 $Referenced\ \ by\ \ OS\_TimeGetMillisecondsPart(),\ \ OS\_TimeGetNanosecondsPart(),\ \ and\ \ OS\_TimeGetSubsecondsPart().$ 

```
5.4.2.13 OS_TimeGetMicrosecondsPart() static uint32 OS_TimeGetMicrosecondsPart ( OS_time_t tm ) [inline], [static]
```

Get microseconds portion (fractional part only) from an OS\_time\_t object.

Extracts the fractional part from a given OS\_time\_t object normalized to units of microseconds.

This function may be used to adapt applications initially implemented using an older OSAL version where OS\_time\_t was a structure containing a "seconds" and "microsecs" field.

This function will obtain a value that is compatible with the "microsecs" field of OS\_time\_t as it was defined in previous versions of OSAL, as well as the "tv\_usec" field of POSIX-style "struct timeval" values.

#### See also

OS\_TimeGetTotalSeconds()

#### **Parameters**

in   tm   Time interval value	m Time interval value
-------------------------------	-----------------------

#### Returns

Number of microseconds in time interval

Definition at line 338 of file osapi-clock.h.

References OS\_TIME\_TICKS\_PER\_USEC, and OS\_TimeGetFractionalPart().

Here is the call graph for this function:

```
5.4.2.14 OS_TimeGetMillisecondsPart() static uint32 OS_TimeGetMillisecondsPart ( OS_time_t tm ) [inline], [static]
```

Get milliseconds portion (fractional part only) from an OS\_time\_t object.

Extracts the fractional part from a given OS\_time\_t object normalized to units of milliseconds.

#### See also

OS\_TimeGetTotalSeconds()

#### **Parameters**

in	tm	Time interval value

#### Returns

Number of milliseconds in time interval

Definition at line 313 of file osapi-clock.h.

References OS\_TIME\_TICKS\_PER\_MSEC, and OS\_TimeGetFractionalPart().

Here is the call graph for this function:

```
5.4.2.15 OS_TimeGetNanosecondsPart() static uint32 OS_TimeGetNanosecondsPart ( OS_time_t tm ) [inline], [static]
```

Get nanoseconds portion (fractional part only) from an OS\_time\_t object.

Extracts the only number of nanoseconds from a given OS\_time\_t object.

This function will obtain a value that is compatible with the "tv\_nsec" field of POSIX-style "struct timespec" values.

#### See also

OS\_TimeGetTotalSeconds()

#### **Parameters**

in	tm	Time interval value

#### Returns

Number of nanoseconds in time interval

Definition at line 357 of file osapi-clock.h.

References OS\_TIME\_TICK\_RESOLUTION\_NS, and OS\_TimeGetFractionalPart().

Here is the call graph for this function:

```
5.4.2.16 OS_TimeGetSubsecondsPart() static uint32 OS_TimeGetSubsecondsPart ( OS_time_t tm ) [inline], [static]
```

Get 32-bit normalized subseconds (fractional part only) from an OS\_time\_t object.

Extracts the fractional part from a given OS\_time\_t object in maximum precision, with units of  $2^{\land}$ (-32) sec. This is a base-2 fixed-point fractional value with the point left-justified in the 32-bit value (i.e. left of MSB).

This is (mostly) compatible with the CFE "subseconds" value, where 0x80000000 represents exactly one half second, and 0 represents a full second.

#### **Parameters**

in	tm	Time interval value
----	----	---------------------

#### Returns

Fractional/subsecond portion of time interval as 32-bit fixed point value

Definition at line 289 of file osapi-clock.h.

References OS\_TIME\_TICKS\_PER\_SECOND, and OS\_TimeGetFractionalPart().

Here is the call graph for this function:

```
5.4.2.17 OS_TimeGetTotalMicroseconds() static int64 OS_TimeGetTotalMicroseconds (
OS_time_t tm ) [inline], [static]
```

Get interval from an OS\_time\_t object normalized to microsecond units.

Note this refers to the complete interval, not just the fractional part.

See also

OS TimeFromTotalMicroseconds()

in	tm	Time interval value
----	----	---------------------

#### **Returns**

Whole number of microseconds in time interval

Definition at line 199 of file osapi-clock.h.

References OS\_TIME\_TICKS\_PER\_USEC, and OS\_time\_t::ticks.

# **5.4.2.18 OS\_TimeGetTotalMilliseconds()** static int64 OS\_TimeGetTotalMilliseconds ( OS\_time\_t tm ) [inline], [static]

Get interval from an OS\_time\_t object normalized to millisecond units.

Note this refers to the complete interval, not just the fractional part.

#### See also

OS\_TimeFromTotalMilliseconds()

#### **Parameters**

in	tm	Time interval value
----	----	---------------------

#### Returns

Whole number of milliseconds in time interval

Definition at line 165 of file osapi-clock.h.

References OS\_TIME\_TICKS\_PER\_MSEC, and OS\_time\_t::ticks.

```
5.4.2.19 OS_TimeGetTotalNanoseconds() static int64 OS_TimeGetTotalNanoseconds (
OS_time_t tm ) [inline], [static]
```

Get interval from an OS\_time\_t object normalized to nanosecond units.

Note this refers to the complete interval, not just the fractional part.

#### Note

There is no protection against overflow of the 64-bit return value. Applications must use caution to ensure that the interval does not exceed the representable range of a signed 64 bit integer - approximately 140 years.

#### See also

OS\_TimeFromTotalNanoseconds

#### **Parameters**

in	tm	Time interval value
	• • • • • • • • • • • • • • • • • • • •	

#### Returns

Whole number of microseconds in time interval

Definition at line 237 of file osapi-clock.h.

References OS\_TIME\_TICK\_RESOLUTION\_NS, and OS\_time\_t::ticks.

```
5.4.2.20 OS_TimeGetTotalSeconds() static int64 OS_TimeGetTotalSeconds ( OS_time_t tm ) [inline], [static]
```

Get interval from an OS\_time\_t object normalized to whole number of seconds.

Extracts the number of whole seconds from a given OS\_time\_t object, discarding any fractional component.

This may also replace a direct read of the "seconds" field from the OS\_time\_t object from previous versions of OSAL, where the structure was defined with separate seconds/microseconds fields.

#### See also

OS\_TimeGetMicrosecondsPart()
OS\_TimeFromTotalSeconds()

## Parameters

in	tm	Time interval value
----	----	---------------------

### Returns

Whole number of seconds in time interval

Definition at line 131 of file osapi-clock.h.

References OS\_TIME\_TICKS\_PER\_SECOND, and OS\_time\_t::ticks.

Computes the difference between two time intervals.

## **Parameters**

in	time1	The first interval
in	time2	The second interval

# Returns

The difference of the two intervals (time1 - time2)

Definition at line 482 of file osapi-clock.h.

References OS\_time\_t::ticks.

# 5.5 OSAL Core Operation APIs

These are for OSAL core operations for startup/initialization, running, and shutdown. Typically only used in bsps, unit tests, psps, etc.

#### **Functions**

void OS\_Application\_Startup (void)

Application startup.

void OS\_Application\_Run (void)

Application run.

int32 OS\_API\_Init (void)

Initialization of API.

void OS\_API\_Teardown (void)

Teardown/de-initialization of OSAL API.

void OS IdleLoop (void)

Background thread implementation - waits forever for events to occur.

void OS\_DeleteAllObjects (void)

delete all resources created in OSAL.

void OS ApplicationShutdown (uint8 flag)

Initiate orderly shutdown.

void OS\_ApplicationExit (int32 Status)

Exit/Abort the application.

int32 OS RegisterEventHandler (OS EventHandler t handler)

Callback routine registration.

#### 5.5.1 Detailed Description

These are for OSAL core operations for startup/initialization, running, and shutdown. Typically only used in bsps, unit tests, psps, etc.

Not intended for user application use

#### 5.5.2 Function Documentation

```
5.5.2.1 OS_API_Init() int32 OS_API_Init ( void )
```

Initialization of API.

This function returns initializes the internal data structures of the OS Abstraction Layer. It must be called in the application startup code before calling any other OS routines.

## Returns

Execution status, see OSAL Return Code Defines. Any error code (negative) means the OSAL can not be initialized. Typical platform specific response is to abort since additional OSAL calls will have undefined behavior.

#### Return values

OS_SUCCESS	Successful execution.
OS_ERROR	Failed execution. (return value only verified in coverage test)

# 5.5.2.2 OS\_API\_Teardown() void OS\_API\_Teardown ( void )

Teardown/de-initialization of OSAL API.

This is the inverse of OS\_API\_Init(). It will release all OS resources and return the system to a state similar to what it was prior to invoking OS\_API\_Init() initially.

Normally for embedded applications, the OSAL is initialized after boot and will remain initialized in memory until the processor is rebooted. However for testing and development purposes, it is potentially useful to reset back to initial conditions.

For testing purposes, this API is designed/intended to be compatible with the UtTest\_AddTeardown() routine provided by the UT-Assert subsystem.

#### Note

This is a "best-effort" routine and it may not always be possible/guaranteed to recover all resources, particularly in the case of off-nominal conditions, or if a resource is used outside of OSAL.

For example, while this will attempt to unload all dynamically-loaded modules, doing so may not be possible and/or may induce undefined behavior if resources are in use by tasks/functions outside of OSAL.

```
5.5.2.3 OS_Application_Run() void OS_Application_Run ( void )
```

Application run.

Run abstraction such that the same BSP can be used for operations and testing.

Application startup.

Startup abstraction such that the same BSP can be used for operations and testing.

Exit/Abort the application.

Indicates that the OSAL application should exit and return control to the OS This is intended for e.g. scripted unit testing where the test needs to end without user intervention.

This function does not return. Production code typically should not ever call this.

Note

This exits the entire process including tasks that have been created.

```
5.5.2.6 OS_ApplicationShutdown() void OS_ApplicationShutdown ( uint8 flag )
```

Initiate orderly shutdown.

Indicates that the OSAL application should perform an orderly shutdown of ALL tasks, clean up all resources, and exit the application.

This allows the task currently blocked in OS\_IdleLoop() to wake up, and for that function to return to its caller.

This is preferred over e.g. OS\_ApplicationExit() which exits immediately and does not provide for any means to clean up first.

#### **Parameters**

```
in flag set to true to initiate shutdown, false to cancel
```

```
5.5.2.7 OS_DeleteAllObjects() void OS_DeleteAllObjects ( void )
```

delete all resources created in OSAL.

provides a means to clean up all resources allocated by this instance of OSAL. It would typically be used during an orderly shutdown but may also be helpful for testing purposes.

```
5.5.2.8 OS_IdleLoop() void OS_IdleLoop ( void )
```

Background thread implementation - waits forever for events to occur.

This should be called from the BSP main routine or initial thread after all other board and application initialization has taken place and all other tasks are running.

Typically just waits forever until "OS shutdown" flag becomes true.

```
5.5.2.9 OS_RegisterEventHandler() int32 OS_RegisterEventHandler ( OS_EventHandler_t handler)
```

Callback routine registration.

This hook enables the application code to perform extra platform-specific operations on various system events such as resource creation/deletion.

## Note

Some events are invoked while the resource is "locked" and therefore application-defined handlers for these events should not block or attempt to access other OSAL resources.

## **Parameters**

in	handler	The application-provided event handler (must not be null)	]
----	---------	---	---

## Returns

Execution status, see OSAL Return Code Defines.

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if handler is NULL

#### 5.6 OSAL Condition Variable APIs

#### **Functions**

int32 OS CondVarCreate (osal id t \*var id, const char \*var name, uint32 options)

Creates a condition variable resource.

int32 OS CondVarLock (osal id t var id)

Locks/Acquires the underlying mutex associated with a condition variable.

int32 OS\_CondVarUnlock (osal\_id\_t var\_id)

Unlocks/Releases the underlying mutex associated with a condition variable.

int32 OS\_CondVarSignal (osal\_id\_t var\_id)

Signals the condition variable resource referenced by var\_id.

int32 OS\_CondVarBroadcast (osal\_id\_t var\_id)

Broadcasts the condition variable resource referenced by var\_id.

int32 OS CondVarWait (osal id t var id)

Waits on the condition variable object referenced by var\_id.

• int32 OS\_CondVarTimedWait (osal\_id\_t var\_id, const OS\_time\_t \*abs\_wakeup\_time)

Time-limited wait on the condition variable object referenced by var\_id.

int32 OS\_CondVarDelete (osal\_id\_t var\_id)

Deletes the specified condition variable.

int32 OS\_CondVarGetIdByName (osal\_id\_t \*var\_id, const char \*var\_name)

Find an existing condition variable ID by name.

int32 OS\_CondVarGetInfo (osal\_id\_t var\_id, OS\_condvar\_prop\_t \*condvar\_prop)

Fill a property object buffer with details regarding the resource.

## 5.6.1 Detailed Description

#### 5.6.2 Function Documentation

```
5.6.2.1 OS_CondVarBroadcast() int32 OS_CondVarBroadcast ( osal_id_t var_id )
```

Broadcasts the condition variable resource referenced by var\_id.

This function may be used to indicate when the state of a data object has been changed.

If there are threads blocked on the condition variable object referenced by var\_id when this function is called, all threads will be unblocked.

Note that although all threads are unblocked, because the mutex is re-acquired before the wait function returns, only a single task will be testing the condition at a given time. The order with which each blocked task runs is determined by the scheduling policy.

#### **Parameters**

in	var←	The object ID to operate on
	_id	

#### Returns

Execution status, see OSAL Return Code Defines

#### Return values

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	if the id passed in is not a valid condition variable

# 

Creates a condition variable resource.

A condition variable adds a more sophisticated synchronization option for mutexes, such that it can operate on arbitrary user-defined conditions rather than simply a counter or boolean (as in the case of simple semaphores).

Creating a condition variable resource in OSAL will in turn create both a basic mutex as well as a synchronization overlay. The underlying mutex is similar to the mutex functionality provided by the OSAL mutex subsystem, and can be locked and unlocked normally.

This mutex is intended to protect access to any arbitrary user-defined data object that serves as the condition being tested.

A task that needs a particular state of the object should follow this general flow:

- · Lock the underlying mutex
- Test for the condition being waited for (a user-defined check on user-defined data)
- If condition IS NOT met, then call OS\_CondVarWait() to wait, then repeat test
- If condition IS met, then unlock the underlying mutex and continue

A task that changes the state of the object should follow this general flow:

- · Lock the underlying mutex
- · Change the state as necessary
- Call either OS\_CondVarSignal() or OS\_CondVarBroadcast()
- · Unlock the underlying mutex

## **Parameters**

out	var_id	will be set to the non-zero ID of the newly-created resource (must not be null)
in	var_name	the name of the new resource to create (must not be null)
in	options	reserved for future use. Should be passed as 0.

## Returns

Execution status, see OSAL Return Code Defines

#### **Return values**

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if var_id or var_name are NULL
OS_ERR_NAME_TOO_LONG	name length including null terminator greater than OS_MAX_API_NAME
OS_ERR_NO_FREE_IDS	if there are no more free condition variable lds
OS_ERR_NAME_TAKEN	if there is already a condition variable with the same name

# **5.6.2.3 OS\_CondVarDelete()** int32 OS\_CondVarDelete ( osal\_id\_t var\_id )

Deletes the specified condition variable.

Delete the condition variable and releases any related system resources.

## **Parameters**

in	var←	The object ID to delete
	_id	

## Returns

Execution status, see OSAL Return Code Defines

#### **Return values**

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	if the id passed in is not a valid condvar

# **5.6.2.4 OS\_CondVarGetIdByName()** int32 OS\_CondVarGetIdByName (

```
osal_id_t * var_id,
const char * var_name )
```

Find an existing condition variable ID by name.

This function tries to find an existing condition variable ID given the name. The id is returned through var\_id.

#### **Parameters**

out	var_id	will be set to the ID of the existing resource	
in	var_name	the name of the existing resource to find (must not be null)	]

## Returns

Execution status, see OSAL Return Code Defines

#### **Return values**

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	is var_id or var_name are NULL pointers
OS_ERR_NAME_TOO_LONG	name length including null terminator greater than OS_MAX_API_NAME
OS_ERR_NAME_NOT_FOUND	if the name was not found in the table

Fill a property object buffer with details regarding the resource.

This function will fill a structure to contain the information (name and creator) about the specified condition variable.

## **Parameters**

in	var_id	The object ID to operate on
out	condvar_prop	The property object buffer to fill (must not be null)

#### Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	if the id passed in is not a valid semaphore
OS_INVALID_POINTER	if the mut_prop pointer is null

```
5.6.2.6 OS_CondVarLock() int32 OS_CondVarLock ( osal_id_t var_id )
```

Locks/Acquires the underlying mutex associated with a condition variable.

The mutex should always be locked by a task before reading or modifying the data object associated with a condition variable.

#### Note

This lock must be acquired by a task before invoking OS\_CondVarWait() or OS\_CondVarTimedWait() on the same condition variable.

#### **Parameters**

in	var⇔	The object ID to operate on
	_id	

#### Returns

Execution status, see OSAL Return Code Defines

#### Return values

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	if the id passed in is not a valid condition variable

```
5.6.2.7 OS_CondVarSignal() int32 OS_CondVarSignal ( osal_id_t var_id )
```

Signals the condition variable resource referenced by var\_id.

This function may be used to indicate when the state of a data object has been changed.

If there are threads blocked on the condition variable object referenced by var\_id when this function is called, one of those threads will be unblocked, as determined by the scheduling policy.

#### **Parameters**

in	var⇔	The object ID to operate on
	_id	

#### Returns

Execution status, see OSAL Return Code Defines

#### Return values

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	if the id passed in is not a valid condition variable

Time-limited wait on the condition variable object referenced by var\_id.

Identical in operation to OS\_CondVarWait(), except that the maximum amount of time that the task will be blocked is limited.

The abs\_wakeup\_time refers to the absolute time of the system clock at which the task should be unblocked to run, regardless of the state of the condition variable. This refers to the same system clock that is the subject of the OS\_GetLocalTime() API.

## **Parameters**

in	var_id	The object ID to operate on
in	abs_wakeup_time	The system time at which the task should be unblocked (must not be null)

## Returns

Execution status, see OSAL Return Code Defines

## Return values

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	the id passed in is not a valid condvar

```
5.6.2.9 OS_CondVarUnlock() int32 OS_CondVarUnlock ( osal_id_t var_id )
```

Unlocks/Releases the underlying mutex associated with a condition variable.

The mutex should be unlocked by a task once reading or modifying the data object associated with a condition variable is complete.

#### **Parameters**

in	var⊷	The object ID to operate on
	_id	

## Returns

Execution status, see OSAL Return Code Defines

#### **Return values**

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	if the id passed in is not a valid condition variable

Waits on the condition variable object referenced by var id.

The calling task will be blocked until another task calls the function OS\_CondVarSignal() or OS\_CondVarBroadcast() on the same condition variable.

The underlying mutex associated with the condition variable must be locked and owned by the calling task at the time this function is invoked. As part of this call, the mutex will be unlocked as the task blocks. This is done in such a way that there is no possibility that another task could aguire the mutex before the calling task has actually blocked.

This atomicity with respect to blocking the task and unlocking the mutex is a critical difference between condition variables and other synchronization primitives. It avoids a window of opportunity where inherent in the simpler synchronization resource types where the state of the data could change between the time that the calling task tested the state and the time that the task actually blocks on the sync resource.

#### **Parameters**

in	var⇔	The object ID to operate on
	_id	

## Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	the id passed in is not a valid condvar

# 5.7 OSAL Counting Semaphore APIs

#### **Functions**

- int32 OS\_CountSemCreate (osal\_id\_t \*sem\_id, const char \*sem\_name, uint32 sem\_initial\_value, uint32 options)

  Creates a counting semaphore.
- int32 OS\_CountSemGive (osal\_id\_t sem\_id)

Increment the semaphore value.

int32 OS CountSemTake (osal id t sem id)

Decrement the semaphore value.

int32 OS\_CountSemTimedWait (osal\_id\_t sem\_id, uint32 msecs)

Decrement the semaphore value with timeout.

int32 OS\_CountSemDelete (osal\_id\_t sem\_id)

Deletes the specified counting Semaphore.

• int32 OS CountSemGetIdByName (osal id t \*sem id, const char \*sem name)

Find an existing semaphore ID by name.

int32 OS\_CountSemGetInfo (osal\_id\_t sem\_id, OS\_count\_sem\_prop\_t \*count\_prop)

Fill a property object buffer with details regarding the resource.

## 5.7.1 Detailed Description

#### 5.7.2 Function Documentation

Creates a counting semaphore.

Creates a counting semaphore with initial value specified by sem\_initial\_value and name specified by sem\_name. sem id will be returned to the caller.

#### Note

Underlying RTOS implementations may or may not impose a specific upper limit to the value of a counting semaphore. If the OS has a specific limit and the sem\_initial\_value exceeds this limit, then OS\_INVALID\_SEM\_VALUE is returned. On other implementations, any 32-bit integer value may be acceptable. For maximum portability, it is recommended to keep counting semaphore values within the range of a "short int" (i.e. between 0 and 32767). Many platforms do accept larger values, but may not be guaranteed.

#### **Parameters**

out	at sem_id will be set to the non-zero ID of the newly-created resource (must no		
in	sem_name	the name of the new resource to create (must not be null)	
in <b>sem_initial_value</b>		the initial value of the counting semaphore Generated	by Doxygen
in	in options Reserved for future use, should be passed as 0.		

#### Returns

Execution status, see OSAL Return Code Defines

#### **Return values**

OS_SUCCESS	Successful execution.	
OS_INVALID_POINTER	if sen name or sem_id are NULL	
OS_ERR_NAME_TOO_LONG	name length including null terminator greater than OS_MAX_API_NAME	
OS_ERR_NO_FREE_IDS	if all of the semaphore ids are taken	
OS_ERR_NAME_TAKEN if this is already the name of a counting semaphore		
OS_INVALID_SEM_VALUE	if the semaphore value is too high (return value only verified in coverage test)	
OS_SEM_FAILURE	if an unspecified implementation error occurs (return value only verified in	
	coverage test)	

# **5.7.2.2 OS\_CountSemDelete()** int32 OS\_CountSemDelete ( osal\_id\_t sem\_id )

Deletes the specified counting Semaphore.

#### **Parameters**

in	sem⊷	The object ID to delete
	_id	

#### Returns

Execution status, see OSAL Return Code Defines

#### **Return values**

OS_SUCCESS	Successful execution.	
OS_ERR_INVALID_ID	if the id passed in is not a valid counting semaphore	
OS_SEM_FAILURE	OS_SEM_FAILURE if an unspecified implementation error occurs (return value only verified in coverage	

# 

Find an existing semaphore ID by name.

This function tries to find a counting sem Id given the name of a count\_sem The id is returned through sem\_id

## **Parameters**

out	sem_id	will be set to the ID of the existing resource
in	sem_name	the name of the existing resource to find (must not be null)

## Returns

Execution status, see OSAL Return Code Defines

## Return values

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	is semid or sem_name are NULL pointers
OS_ERR_NAME_TOO_LONG	name length including null terminator greater than OS_MAX_API_NAME
OS_ERR_NAME_NOT_FOUND	if the name was not found in the table

Fill a property object buffer with details regarding the resource.

This function will pass back a pointer to structure that contains all of the relevant info( name and creator) about the specified counting semaphore.

## **Parameters**

in	sem_id	The object ID to operate on
out	count_prop	The property object buffer to fill (must not be null)

# Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	if the id passed in is not a valid semaphore
OS_INVALID_POINTER	if the count_prop pointer is null

Increment the semaphore value.

The function unlocks the semaphore referenced by sem\_id by performing a semaphore unlock operation on that semaphore. If the semaphore value resulting from this operation is positive, then no threads were blocked waiting for the semaphore to become unlocked; the semaphore value is simply incremented for this semaphore.

#### **Parameters**

in	sem←	The object ID to operate on
	_id	

## Returns

Execution status, see OSAL Return Code Defines

## **Return values**

OS_SUCCESS	Successful execution.	
OS_ERR_INVALID_ID	if the id passed in is not a counting semaphore	
OS_SEM_FAILURE	if an unspecified implementation error occurs (return value only verified in coverage test)	

# **5.7.2.6 OS\_CountSemTake()** int32 OS\_CountSemTake ( osal\_id\_t sem\_id )

Decrement the semaphore value.

The locks the semaphore referenced by sem\_id by performing a semaphore lock operation on that semaphore. If the semaphore value is currently zero, then the calling thread shall not return from the call until it either locks the semaphore or the call is interrupted.

## **Parameters**

in	sem←	The object ID to operate on
	_id	

#### Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.

## **Return values**

OS_ERR_INVALID_ID	the ld passed in is not a valid counting semaphore
OS_SEM_FAILURE	if an unspecified implementation error occurs (return value only verified in coverage test)

Decrement the semaphore value with timeout.

The function locks the semaphore referenced by sem\_id. However, if the semaphore cannot be locked without waiting for another process or thread to unlock the semaphore, this wait shall be terminated when the specified timeout, msecs, expires.

## **Parameters**

in	sem←	The object ID to operate on
	_id	
in	msecs	The maximum amount of time to block, in milliseconds

## Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.
OS_SEM_TIMEOUT	if semaphore was not relinquished in time
OS_ERR_INVALID_ID	if the ID passed in is not a valid semaphore ID
OS_SEM_FAILURE	if an unspecified implementation error occurs (return value only verified in coverage test)

# 5.8 OSAL Directory APIs

## **Functions**

int32 OS\_DirectoryOpen (osal\_id\_t \*dir\_id, const char \*path)

Opens a directory.

int32 OS\_DirectoryClose (osal\_id\_t dir\_id)

Closes an open directory.

int32 OS\_DirectoryRewind (osal\_id\_t dir\_id)

Rewinds an open directory.

• int32 OS\_DirectoryRead (osal\_id\_t dir\_id, os\_dirent\_t \*dirent)

Reads the next name in the directory.

• int32 OS\_mkdir (const char \*path, uint32 access)

Makes a new directory.

• int32 OS\_rmdir (const char \*path)

Removes a directory from the file system.

## 5.8.1 Detailed Description

## 5.8.2 Function Documentation

```
5.8.2.1 OS_DirectoryClose() int32 OS_DirectoryClose ( osal_id_t dir_id )
```

Closes an open directory.

The directory referred to by dir\_id will be closed

#### **Parameters**

in	dir⊷	The handle ID of the directory	
	_id		

## Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	if the directory handle is invalid

Opens a directory.

Prepares for reading the files within a directory

#### **Parameters**

ĺ	out	dir←	Location to store handle ID of the directory (must not be null)
		_id	
	in	path	The directory to open (must not be null)

## Returns

Execution status, see OSAL Return Code Defines

#### Return values

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if dir_id or path is NULL
OS_FS_ERR_PATH_TOO_LONG	if the path argument exceeds the maximum length
OS_FS_ERR_PATH_INVALID	if the path argument is not valid
OS_ERROR	if the directory could not be opened

```
5.8.2.3 OS_DirectoryRead() int32 OS_DirectoryRead ( osal_id_t dir_id, os_dirent_t * dirent )
```

Reads the next name in the directory.

Obtains directory entry data for the next file from an open directory

## **Parameters**

in	dir←	The handle ID of the directory
	_id	
out	dirent	Buffer to store directory entry information (must not be null)

## Returns

Execution status, see OSAL Return Code Defines

## **Return values**

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if dirent argument is NULL
OS_ERR_INVALID_ID	if the directory handle is invalid
OS_ERROR	at the end of the directory or if the OS call otherwise fails

```
5.8.2.4 OS_DirectoryRewind() int32 OS_DirectoryRewind ( osal\_id\_t \ dir\_id )
```

Rewinds an open directory.

Resets a directory read handle back to the first file.

## **Parameters**

in	dir⇔	The handle ID of the directory
	_id	

## Returns

Execution status, see OSAL Return Code Defines

#### Return values

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	if the directory handle is invalid

Makes a new directory.

Makes a directory specified by path.

## **Parameters**

in	path	The new directory name (must not be null)
in	access	The permissions for the directory (reserved for future use)

#### Note

Current implementations do not utilize the "access" parameter. Applications should still pass the intended value (OS\_READ\_WRITE or OS\_READ\_ONLY) to be compatible with future implementations.

#### Returns

Execution status, see OSAL Return Code Defines

## Return values

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if path is NULL
OS_FS_ERR_PATH_TOO_LONG	if the path is too long to be stored locally
OS_FS_ERR_PATH_INVALID	if path cannot be parsed
OS_ERROR	if the OS call fails (return value only verified in coverage test)

```
5.8.2.6 OS_rmdir() int32 OS_rmdir ( const char * path )
```

Removes a directory from the file system.

Removes a directory from the structure. The directory must be empty prior to this operation.

## **Parameters**

in	path	The directory to remove

## Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if path is NULL
OS_FS_ERR_PATH_INVALID	if path cannot be parsed
OS_FS_ERR_PATH_TOO_LONG	
OS_ERROR	if the directory remove operation failed (return value only verified in coverage
	test)

## 5.9 OSAL Return Code Defines

The specific status/return code definitions listed in this section may be extended or refined in future versions of OSAL.

#### **Macros**

```
• #define OS_SUCCESS (0)
     Successful execution.
• #define OS_ERROR (-1)
     Failed execution.

    #define OS_INVALID_POINTER (-2)

     Invalid pointer.

    #define OS_ERROR_ADDRESS_MISALIGNED (-3)

     Address misalignment.

    #define OS ERROR TIMEOUT (-4)

     Error timeout.
• #define OS_INVALID_INT_NUM (-5)
     Invalid Interrupt number.

    #define OS_SEM_FAILURE (-6)

     Semaphore failure.
• #define OS_SEM_TIMEOUT (-7)
     Semaphore timeout.

    #define OS_QUEUE_EMPTY (-8)

     Queue empty.
• #define OS_QUEUE_FULL (-9)
     Queue full.

    #define OS_QUEUE_TIMEOUT (-10)

     Queue timeout.
• #define OS_QUEUE_INVALID_SIZE (-11)
     Queue invalid size.
• #define OS QUEUE ID ERROR (-12)
     Queue ID error.

    #define OS_ERR_NAME_TOO_LONG (-13)

     name length including null terminator greater than OS_MAX_API_NAME

    #define OS ERR NO FREE IDS (-14)

     No free IDs.
• #define OS_ERR_NAME_TAKEN (-15)
     Name taken.

    #define OS_ERR_INVALID_ID (-16)

     Invalid ID.

    #define OS_ERR_NAME_NOT_FOUND (-17)

     Name not found.

    #define OS_ERR_SEM_NOT_FULL (-18)

     Semaphore not full.

    #define OS ERR INVALID PRIORITY (-19)

     Invalid priority.
```

```
• #define OS_INVALID_SEM_VALUE (-20)
     Invalid semaphore value.

    #define OS ERR FILE (-27)

     File error.
• #define OS ERR NOT IMPLEMENTED (-28)
     Not implemented.
• #define OS_TIMER_ERR_INVALID_ARGS (-29)
     Timer invalid arguments.
• #define OS TIMER ERR TIMER ID (-30)
     Timer ID error.
• #define OS_TIMER_ERR_UNAVAILABLE (-31)
     Timer unavailable.

    #define OS_TIMER_ERR_INTERNAL (-32)

     Timer internal error.

    #define OS_ERR_OBJECT_IN_USE (-33)

     Object in use.

    #define OS_ERR_BAD_ADDRESS (-34)

     Bad address.
• #define OS ERR INCORRECT OBJ STATE (-35)
     Incorrect object state.
• #define OS_ERR_INCORRECT_OBJ_TYPE (-36)
     Incorrect object type.
• #define OS_ERR_STREAM_DISCONNECTED (-37)
     Stream disconnected.
• #define OS_ERR_OPERATION_NOT_SUPPORTED (-38)
     Requested operation not support on supplied object(s)

    #define OS_ERR_INVALID_SIZE (-40)

     Invalid Size.
• #define OS_ERR_OUTPUT_TOO_LARGE (-41)
     Size of output exceeds limit

    #define OS ERR INVALID ARGUMENT (-42)

     Invalid argument value (other than ID or size)
• #define OS_FS_ERR_PATH_TOO_LONG (-103)
     FS path too long.

    #define OS_FS_ERR_NAME_TOO_LONG (-104)

     FS name too long.

    #define OS_FS_ERR_DRIVE_NOT_CREATED (-106)

     FS drive not created.
• #define OS_FS_ERR_DEVICE_NOT_FREE (-107)
     FS device not free.
• #define OS FS ERR PATH INVALID (-108)
     FS path invalid.
```

## 5.9.1 Detailed Description

The specific status/return code definitions listed in this section may be extended or refined in future versions of OSAL.

Note

Application developers should assume that any OSAL API may return any status value listed here. While the documentation of each OSAL API function indicates the return/status values that function may directly generate, functions may also pass through other status codes from related functions, so that list should not be considered absolute/exhaustive.

The int32 data type should be used to store an OSAL status code. Negative values will always represent errors, while non-negative values indicate success. Most APIs specifically return OS\_SUCCESS (0) upon successful execution, but some return a nonzero value, such as data size.

Ideally, in order to more easily adapt to future OSAL versions and status code extensions/refinements, applications should typically check for errors as follows:

```
int32 status;
status = OS_TaskCreate(...); (or any other API)
if (status < OS_SUCCESS)
{
    handle or report error...
    may also check for specific codes here.
}
else
{
    handle normal/successful status...
}</pre>
```

#### 5.9.2 Macro Definition Documentation

```
5.9.2.1 OS_ERR_BAD_ADDRESS #define OS_ERR_BAD_ADDRESS (-34)
```

Bad address.

Definition at line 124 of file osapi-error.h.

```
5.9.2.2 OS_ERR_FILE #define OS_ERR_FILE (-27)
```

File error.

Definition at line 117 of file osapi-error.h.

**5.9.2.3 OS\_ERR\_INCORRECT\_OBJ\_STATE** #define OS\_ERR\_INCORRECT\_OBJ\_STATE (-35)

Incorrect object state.

Definition at line 125 of file osapi-error.h.

**5.9.2.4 OS\_ERR\_INCORRECT\_OBJ\_TYPE** #define OS\_ERR\_INCORRECT\_OBJ\_TYPE (-36)

Incorrect object type.

Definition at line 126 of file osapi-error.h.

5.9.2.5 OS\_ERR\_INVALID\_ARGUMENT #define OS\_ERR\_INVALID\_ARGUMENT (-42)

Invalid argument value (other than ID or size)

Definition at line 131 of file osapi-error.h.

**5.9.2.6 OS\_ERR\_INVALID\_ID** #define OS\_ERR\_INVALID\_ID (-16)

Invalid ID.

Definition at line 112 of file osapi-error.h.

**5.9.2.7 OS\_ERR\_INVALID\_PRIORITY** #define OS\_ERR\_INVALID\_PRIORITY (-19)

Invalid priority.

Definition at line 115 of file osapi-error.h.

**5.9.2.8 OS\_ERR\_INVALID\_SIZE** #define OS\_ERR\_INVALID\_SIZE (-40)

Invalid Size.

Definition at line 129 of file osapi-error.h.

**5.9.2.9 OS\_ERR\_NAME\_NOT\_FOUND** #define OS\_ERR\_NAME\_NOT\_FOUND (-17)

Name not found.

Definition at line 113 of file osapi-error.h.

**5.9.2.10 OS\_ERR\_NAME\_TAKEN** #define OS\_ERR\_NAME\_TAKEN (-15)

Name taken.

Definition at line 111 of file osapi-error.h.

**5.9.2.11 OS\_ERR\_NAME\_TOO\_LONG** #define OS\_ERR\_NAME\_TOO\_LONG (-13)

name length including null terminator greater than OS\_MAX\_API\_NAME

Definition at line 109 of file osapi-error.h.

**5.9.2.12 OS\_ERR\_NO\_FREE\_IDS** #define OS\_ERR\_NO\_FREE\_IDS (-14)

No free IDs.

Definition at line 110 of file osapi-error.h.

**5.9.2.13 OS\_ERR\_NOT\_IMPLEMENTED** #define OS\_ERR\_NOT\_IMPLEMENTED (-28)

Not implemented.

Definition at line 118 of file osapi-error.h.

**5.9.2.14 OS\_ERR\_OBJECT\_IN\_USE** #define OS\_ERR\_OBJECT\_IN\_USE (-33)

Object in use.

Definition at line 123 of file osapi-error.h.

**5.9.2.15 OS\_ERR\_OPERATION\_NOT\_SUPPORTED** #define OS\_ERR\_OPERATION\_NOT\_SUPPORTED (-38)

Requested operation not support on supplied object(s)

Definition at line 128 of file osapi-error.h.

**5.9.2.16 OS\_ERR\_OUTPUT\_TOO\_LARGE** #define OS\_ERR\_OUTPUT\_TOO\_LARGE (-41)

Size of output exceeds limit

Definition at line 130 of file osapi-error.h.

**5.9.2.17 OS\_ERR\_SEM\_NOT\_FULL** #define OS\_ERR\_SEM\_NOT\_FULL (-18)

Semaphore not full.

Definition at line 114 of file osapi-error.h.

**5.9.2.18 OS\_ERR\_STREAM\_DISCONNECTED** #define OS\_ERR\_STREAM\_DISCONNECTED (-37)

Stream disconnected.

Definition at line 127 of file osapi-error.h.

**5.9.2.19 OS\_ERROR** #define OS\_ERROR (-1)

Failed execution.

5.10 OSAL Error Info APIs 61

## 5.10 OSAL Error Info APIs

#### **Functions**

• static long OS\_StatusToInteger (osal\_status\_t Status)

Convert a status code to a native "long" type.

• int32 OS\_GetErrorName (int32 error\_num, os\_err\_name\_t \*err\_name)

Convert an error number to a string.

char \* OS\_StatusToString (osal\_status\_t status, os\_status\_string\_t \*status\_string)

Convert status to a string.

## 5.10.1 Detailed Description

#### 5.10.2 Function Documentation

Convert an error number to a string.

## **Parameters**

in	error_num	Error number to convert
out	err_name	Buffer to store error string

## Returns

Execution status, see OSAL Return Code Defines

## **Return values**

OS_SUCCESS	if successfully converted to a string
OS_INVALID_POINTER	if err_name is NULL
OS_ERROR	if error could not be converted

```
5.10.2.2 OS_StatusToInteger() static long OS_StatusToInteger ( osal_status_t Status ) [inline], [static]
```

Convert a status code to a native "long" type.

For printing or logging purposes, this converts the given status code to a "long" (signed integer) value. It should be used in conjunction with the "%Id" conversion specifier in printf-style statements.

## **Parameters**

i	n	Status	Execution status, see OSAL Return Code Defines
---	---	--------	--

## Returns

Same status value converted to the "long" data type

Definition at line 164 of file osapi-error.h.

Convert status to a string.

#### **Parameters**

in	status	Status value to convert
out	status_string	Buffer to store status converted to string

## Returns

Passed in string pointer

# 5.11 OSAL File Access Option Defines

#### **Macros**

- #define OS\_READ\_ONLY 0
- #define OS\_WRITE\_ONLY 1
- #define OS\_READ\_WRITE 2

## 5.11.1 Detailed Description

## 5.11.2 Macro Definition Documentation

## 5.11.2.1 OS\_READ\_ONLY #define OS\_READ\_ONLY 0

Read only file access

Definition at line 35 of file osapi-file.h.

## **5.11.2.2 OS\_READ\_WRITE** #define OS\_READ\_WRITE 2

Read write file access

Definition at line 37 of file osapi-file.h.

# $\textbf{5.11.2.3} \quad \textbf{OS\_WRITE\_ONLY} \quad \texttt{\#define OS\_WRITE\_ONLY 1}$

Write only file access

Definition at line 36 of file osapi-file.h.

# 5.12 OSAL Reference Point For Seek Offset Defines

#### Macros

- #define OS\_SEEK\_SET 0
- #define OS\_SEEK\_CUR 1
- #define OS\_SEEK\_END 2

## 5.12.1 Detailed Description

## 5.12.2 Macro Definition Documentation

```
5.12.2.1 OS_SEEK_CUR #define OS_SEEK_CUR 1
```

Seek offset current

Definition at line 44 of file osapi-file.h.

Seek offset end

Definition at line 45 of file osapi-file.h.

$$\textbf{5.12.2.3} \quad \textbf{OS\_SEEK\_SET} \quad \texttt{\#define OS\_SEEK\_SET 0}$$

Seek offset set

Definition at line 43 of file osapi-file.h.

## 5.13 OSAL Standard File APIs

#### **Functions**

```
• int32 OS_OpenCreate (osal_id_t *filedes, const char *path, int32 flags, int32 access_mode)
```

Open or create a file.

int32 OS\_close (osal\_id\_t filedes)

Closes an open file handle.

int32 OS\_read (osal\_id\_t filedes, void \*buffer, size\_t nbytes)

Read from a file handle.

int32 OS\_write (osal\_id\_t filedes, const void \*buffer, size\_t nbytes)

Write to a file handle.

int32 OS\_TimedRead (osal\_id\_t filedes, void \*buffer, size\_t nbytes, int32 timeout)

File/Stream input read with a timeout.

int32 OS TimedWrite (osal id t filedes, const void \*buffer, size t nbytes, int32 timeout)

File/Stream output write with a timeout.

int32 OS chmod (const char \*path, uint32 access mode)

Changes the permissions of a file.

int32 OS stat (const char \*path, os fstat t \*filestats)

Obtain information about a file or directory.

int32 OS\_lseek (osal\_id\_t filedes, int32 offset, uint32 whence)

Seeks to the specified position of an open file.

int32 OS\_remove (const char \*path)

Removes a file from the file system.

int32 OS\_rename (const char \*old\_filename, const char \*new\_filename)

Renames a file.

int32 OS\_cp (const char \*src, const char \*dest)

Copies a single file from src to dest.

• int32 OS\_mv (const char \*src, const char \*dest)

Move a single file from src to dest.

int32 OS\_FDGetInfo (osal\_id\_t filedes, OS\_file\_prop\_t \*fd\_prop)

Obtain information about an open file.

• int32 OS\_FileOpenCheck (const char \*Filename)

Checks to see if a file is open.

int32 OS\_CloseAllFiles (void)

Close all open files.

int32 OS\_CloseFileByName (const char \*Filename)

Close a file by filename.

#### 5.13.1 Detailed Description

#### 5.13.2 Function Documentation

Changes the permissions of a file.

in	path	File to change (must not be null)
in	access_mode	Desired access mode - see OSAL File Access Option Defines

## Note

Some file systems do not implement permissions. If the underlying OS does not support this operation, then OS\_ERR\_NOT\_IMPLEMENTED is returned.

## Returns

Execution status, see OSAL Return Code Defines

## **Return values**

OS_SUCCESS	Successful execution. (return value only verified in coverage test)
OS_ERR_NOT_IMPLEMENTED	if the filesystem does not support this call
OS_INVALID_POINTER	if the path argument is NULL

Closes an open file handle.

This closes regular file handles and any other file-like resource, such as network streams or pipes.

#### **Parameters**

in	filedes	The handle ID to operate on
----	---------	-----------------------------

## Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	if the file descriptor passed in is invalid
OS_ERROR	if an unexpected/unhandled error occurs (return value only verified in coverage test)

```
5.13.2.3 OS_CloseAllFiles() int32 OS_CloseAllFiles ( void )
```

Close all open files.

Closes All open files that were opened through the OSAL

#### **Returns**

Execution status, see OSAL Return Code Defines

#### **Return values**

OS_SUCCESS	Successful execution.
OS_ERROR	if one or more file close returned an error (return value only verified in coverage test)

# **5.13.2.4 OS\_CloseFileByName()** int32 OS\_CloseFileByName ( const char \* Filename )

Close a file by filename.

Allows a file to be closed by name. This will only work if the name passed in is the same name used to open the file.

## **Parameters**

in	Filename	The file to close (must not be null)
----	----------	--------------------------------------

## Returns

Execution status, see OSAL Return Code Defines

#### **Return values**

OS_SUCCESS	Successful execution.
OS_FS_ERR_PATH_INVALID	if the file is not found
OS_ERROR	if the file close returned an error (return value only verified in coverage test)
OS_INVALID_POINTER	if the filename argument is NULL

```
5.13.2.5 OS_cp() int32 OS_cp ( const char * src, const char * dest )
```

Copies a single file from src to dest.

#### Note

The behavior of this API on an open file is not defined at the OSAL level due to dependencies on the underlying OS which may or may not allow the related operation based on a variety of potential configurations. For portability, it is recommended that applications ensure the file is closed prior to removal.

## **Parameters**

in	src	The source file to operate on (must not be null)
in dest The destination file (must not be null)		

#### Returns

Execution status, see OSAL Return Code Defines

#### **Return values**

OS_SUCCESS	Successful execution.
OS_ERROR	if the file could not be accessed
OS_INVALID_POINTER	if src or dest are NULL
OS_FS_ERR_PATH_INVALID	if path cannot be parsed
OS_FS_ERR_PATH_TOO_LONG	if the paths given are too long to be stored locally
OS_FS_ERR_NAME_TOO_LONG	if the dest name is too long to be stored locally

Obtain information about an open file.

Copies the information of the given file descriptor into a structure passed in

## **Parameters**

in	filedes	The handle ID to operate on
out	fd_prop	Storage buffer for file information (must not be null)

## Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.

## **Return values**

OS_ERR_INVALID_ID	if the file descriptor passed in is invalid
OS_INVALID_POINTER	if the fd_prop argument is NULL

# **5.13.2.7 OS\_FileOpenCheck()** int32 OS\_FileOpenCheck ( const char \* *Filename* )

Checks to see if a file is open.

This function takes a filename and determines if the file is open. The function will return success if the file is open.

#### **Parameters**

	in	Filename	The file to operate on (must not be null)	
--	----	----------	---	--

#### Returns

Execution status, see OSAL Return Code Defines

#### **Return values**

OS_SUCCESS	if the file is open
OS_ERROR	if the file is not open
OS_INVALID_POINTER	if the filename argument is NULL

Seeks to the specified position of an open file.

Sets the read/write pointer to a specific offset in a specific file.

#### **Parameters**

in	filedes	The handle ID to operate on	
in	offset The file offset to seek to		
in	in whence The reference point for offset, see OSAL Reference Point For Seek Offset Define		

#### Returns

Byte offset from the beginning of the file or appropriate error code, see OSAL Return Code Defines

#### **Return values**

OS_ERR_INVALID_ID	if the file descriptor passed in is invalid
OS_ERROR	if OS call failed (return value only verified in coverage test)

```
5.13.2.9 OS_mv() int32 OS_mv ( const char * src, const char * dest )
```

Move a single file from src to dest.

This first attempts to rename the file, which is faster if the source and destination reside on the same file system.

If this fails, it falls back to copying the file and removing the original.

#### Note

The behavior of this API on an open file is not defined at the OSAL level due to dependencies on the underlying OS which may or may not allow the related operation based on a variety of potential configurations. For portability, it is recommended that applications ensure the file is closed prior to removal.

# **Parameters**

	in	src	The source file to operate on (must not be null)	
in dest The destination file (must not be null)		The destination file (must not be null)		

## Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.
OS_ERROR	if the file could not be renamed.
OS_INVALID_POINTER	if src or dest are NULL
OS_FS_ERR_PATH_INVALID	if path cannot be parsed
OS_FS_ERR_PATH_TOO_LONG	if the paths given are too long to be stored locally
OS_FS_ERR_NAME_TOO_LONG	if the dest name is too long to be stored locally

Open or create a file.

Implements the same as OS\_open/OS\_creat but follows the OSAL paradigm of outputting the ID/descriptor separately from the return value, rather than relying on the user to convert it back.

## **Parameters**

out	filedes	The handle ID (OS_OBJECT_ID_UNDEFINED on failure) (must not be null)
in	path File name to create or open (must not be null)	
in	The file permissions - see OS_file_flag_t	
in	access_mode Intended access mode - see OSAL File Access Option Defines	

## Returns

Execution status, see OSAL Return Code Defines

#### **Return values**

OS_SUCCESS	Successful execution.
OS_ERROR	if the command was not executed properly
OS_INVALID_POINTER	if pointer argument was NULL
OS_ERR_NO_FREE_IDS	if all available file handles are in use
OS_FS_ERR_NAME_TOO_LONG	if the filename portion of the path exceeds OS_MAX_FILE_NAME
OS_FS_ERR_PATH_INVALID	if the path argument is not valid
OS_FS_ERR_PATH_TOO_LONG	if the path argument exceeds OS_MAX_PATH_LEN

Read from a file handle.

Reads up to nbytes from a file, and puts them into buffer.

If the file position is at the end of file (or beyond, if the OS allows) then this function will return 0.

## **Parameters**

in filedes The handle ID to operate on		
out	buffer	Storage location for file data (must not be null)
Generated by Indayges Maximum number of bytes to read (must not be zero		

#### Note

All OSAL error codes are negative int32 values. Failure of this call can be checked by testing if the result is less than 0.

## Returns

A non-negative byte count or appropriate error code, see OSAL Return Code Defines

#### **Return values**

OS_INVALID_POINTER	if buffer is a null pointer
OS_ERR_INVALID_SIZE	if the passed-in size is not valid
OS_ERROR	if OS call failed (return value only verified in coverage test)
OS_ERR_INVALID_ID	if the file descriptor passed in is invalid
0	if at end of file/stream data

# 

Removes a file from the file system.

Removes a given filename from the drive

#### Note

The behavior of this API on an open file is not defined at the OSAL level due to dependencies on the underlying OS which may or may not allow the related operation based on a variety of potential configurations. For portability, it is recommended that applications ensure the file is closed prior to removal.

## **Parameters**

in	nath	The file to operate on (must not be null)	ĺ
T11	μαιτι	The life to operate on (must not be null)	l

## Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.
OS_ERROR	if there is no device or the driver returns error
OS_INVALID_POINTER	if path is NULL
OS_FS_ERR_PATH_TOO_LONG	if path is too long to be stored locally
OS_FS_ERR_PATH_INVALID	if path cannot be parsed
OS_FS_ERR_NAME_TOO_LONG	if the name of the file to remove is too long

Renames a file.

Changes the name of a file, where the source and destination reside on the same file system.

#### Note

The behavior of this API on an open file is not defined at the OSAL level due to dependencies on the underlying OS which may or may not allow the related operation based on a variety of potential configurations. For portability, it is recommended that applications ensure the file is closed prior to removal.

#### **Parameters**

in	old_filename	The original filename (must not be null)
in	new_filename	The desired filename (must not be null)

## Returns

Execution status, see OSAL Return Code Defines

## **Return values**

OS_SUCCESS	Successful execution.
OS_ERROR	if the file could not be opened or renamed.
OS_INVALID_POINTER	if old or new are NULL
OS_FS_ERR_PATH_INVALID	if path cannot be parsed
OS_FS_ERR_PATH_TOO_LONG	if the paths given are too long to be stored locally
OS_FS_ERR_NAME_TOO_LONG	if the new name is too long to be stored locally

Obtain information about a file or directory.

Returns information about a file or directory in an os\_fstat\_t structure

in	path	The file to operate on (must not be null)
out	filestats	Buffer to store file information (must not be null)

#### Returns

Execution status, see OSAL Return Code Defines

#### Return values

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if path or filestats is NULL
OS_FS_ERR_PATH_TOO_LONG	if the path is too long to be stored locally
OS_FS_ERR_NAME_TOO_LONG	if the name of the file is too long to be stored
OS_FS_ERR_PATH_INVALID	if path cannot be parsed
OS_ERROR	if the OS call failed

File/Stream input read with a timeout.

This implements a time-limited read and is primarily intended for use with sockets but may also work with any other stream-like resource that the underlying OS supports, such as pipes or special devices.

If data is immediately available on the file/socket, this will return that data along with the actual number of bytes that were immediately available. It will not block.

If the file position is at the end of file or end of stream data (e.g. if the remote end has closed the connection), then this function will immediately return 0 without blocking for the timeout period.

If no data is immediately available, but the underlying resource/stream is still connected to a peer, this will wait up to the given timeout for additional data to appear. If no data appears within the timeout period, then this returns the OS\_ERROR\_TIMEOUT status code. This allows the caller to differentiate an open (but idle) socket connection from a connection which has been closed by the remote peer.

In all cases this will return successfully as soon as at least 1 byte of actual data is available. It will not attempt to read the entire input buffer.

If an EOF condition occurs prior to timeout, this function returns zero.

in	filedes	The handle ID to operate on
out	buffer	Storage location for file data (must not be null)
in	nbytes	Maximum number of bytes to read (must not be zero)
in	timeout	Maximum time to wait, in milliseconds (OS_PEND = forever)

#### Returns

Byte count on success or appropriate error code, see OSAL Return Code Defines

#### Return values

OS_ERROR_TIMEOUT	if no data became available during timeout period
OS_ERR_INVALID_ID	if the file descriptor passed in is invalid
OS_ERR_INVALID_SIZE	if the passed-in size is not valid
OS_INVALID_POINTER	if the passed-in buffer is not valid
0	if at end of file/stream data

File/Stream output write with a timeout.

This implements a time-limited write and is primarily intended for use with sockets but may also work with any other stream-like resource that the underlying OS supports.

If output buffer space is immediately available on the file/socket, this will place data into the buffer and return the actual number of bytes that were queued for output. It will not block.

If no output buffer space is immediately available, this will wait up to the given timeout for space to become available. If no space becomes available within the timeout period, then this returns an error code (not zero).

In all cases this will return successfully as soon as at least 1 byte of actual data is output. It will *not* attempt to write the entire output buffer.

If an EOF condition occurs prior to timeout, this function returns zero.

#### **Parameters**

in	filedes	The handle ID to operate on
in	buffer	Source location for file data (must not be null)
in	nbytes	Maximum number of bytes to read (must not be zero)
in	timeout	Maximum time to wait, in milliseconds (OS PEND = forever)

Generated by Doxygen

#### Returns

A non-negative byte count or appropriate error code, see OSAL Return Code Defines

#### **Return values**

OS_ERROR_TIMEOUT	if no data became available during timeout period
OS_ERR_INVALID_ID	if the file descriptor passed in is invalid
OS_ERR_INVALID_SIZE	if the passed-in size is not valid
OS_INVALID_POINTER	if the passed-in buffer is not valid
0	if file/stream cannot accept any more data

Write to a file handle.

Writes to a file. copies up to a maximum of nbytes of buffer to the file described in filedes

## **Parameters**

in	filedes	The handle ID to operate on
in	buffer	Source location for file data (must not be null)
in	nbytes	Maximum number of bytes to read (must not be zero)

#### Note

All OSAL error codes are negative int32 values. Failure of this call can be checked by testing if the result is less than 0.

## Returns

A non-negative byte count or appropriate error code, see OSAL Return Code Defines

OS_INVALID_POINTER	if buffer is NULL
OS_ERR_INVALID_SIZE	if the passed-in size is not valid
OS_ERROR	if OS call failed (return value only verified in coverage test)
OS_ERR_INVALID_ID	if the file descriptor passed in is invalid
0	if file/stream cannot accept any more data

## 5.14 OSAL File System Level APIs

#### **Functions**

int32 OS FileSysAddFixedMap (osal id t\*filesys id, const char \*phys path, const char \*virt path)

Create a fixed mapping between an existing directory and a virtual OSAL mount point.

 int32 OS\_mkfs (char \*address, const char \*devname, const char \*volname, size\_t blocksize, osal\_blockcount\_t numblocks)

Makes a file system on the target.

int32 OS mount (const char \*devname, const char \*mountpoint)

Mounts a file system.

int32 OS\_initfs (char \*address, const char \*devname, const char \*volname, size\_t blocksize, osal\_blockcount\_t numblocks)

Initializes an existing file system.

• int32 OS\_rmfs (const char \*devname)

Removes a file system.

int32 OS unmount (const char \*mountpoint)

Unmounts a mounted file system.

int32 OS FileSysStatVolume (const char \*name, OS statvfs t \*statbuf)

Obtains information about size and free space in a volume.

int32 OS chkfs (const char \*name, bool repair)

Checks the health of a file system and repairs it if necessary.

int32 OS\_FS\_GetPhysDriveName (char \*PhysDriveName, const char \*MountPoint)

Obtains the physical drive name associated with a mount point.

int32 OS\_TranslatePath (const char \*VirtualPath, char \*LocalPath)

Translates an OSAL Virtual file system path to a host Local path.

int32 OS\_GetFsInfo (os\_fsinfo\_t \*filesys\_info)

Returns information about the file system.

## 5.14.1 Detailed Description

#### 5.14.2 Function Documentation

Checks the health of a file system and repairs it if necessary.

Checks the drives for inconsistencies and optionally also repairs it

Note

not all operating systems implement this function. If the underlying OS does not provide a facility to check the volume, then OS\_ERR\_NOT\_IMPLEMENTED will be returned.

in	name	The device/path to operate on (must not be null)
in	repair	Whether to also repair inconsistencies

## Returns

Execution status, see OSAL Return Code Defines

## **Return values**

OS_SUCCESS	Successful execution. (return value only verified in coverage test)
OS_INVALID_POINTER	Name is NULL
OS_ERR_NOT_IMPLEMENTED	Not implemented.
OS_FS_ERR_PATH_TOO_LONG	if the name is too long
OS_ERROR	Failed execution. (return value only verified in coverage test)

Create a fixed mapping between an existing directory and a virtual OSAL mount point.

This mimics the behavior of a "FS\_BASED" entry in the VolumeTable but is registered at runtime. It is intended to be called by the PSP/BSP prior to starting the application.

## Note

OSAL virtual mount points are required to be a single, non-empty top-level directory name. Virtual path names always follow the form /<virt\_mount\_point>/<relative\_path>/<file>. Only the relative path may be omitted/empty (i.e. /<virt\_mount\_point>/<file>) but the virtual mount point must be present and not an empty string. In particular this means it is not possible to directly refer to files in the "root" of the native file system from OSAL. However it is possible to create a virtual map to the root, such as by calling:

```
OS_FileSysAddFixedMap(&fs_id, "/", "/root");
```

## **Parameters**

out	filesys_id	A buffer to store the ID of the file system mapping (must not be null)
in	phys_path	The native system directory (an existing mount point) (must not be null)
in	virt_path	The virtual mount point of this filesystem (must not be null)

#### Returns

Execution status, see OSAL Return Code Defines

#### **Return values**

OS_SUCCESS	Successful execution.
OS_FS_ERR_PATH_TOO_LONG	if the overall phys_path is too long
OS_ERR_NAME_TOO_LONG	if the phys_path basename (filesystem name) is too long
OS_INVALID_POINTER	if any argument is NULL

Obtains information about size and free space in a volume.

Populates the supplied OS\_statvfs\_t structure, which includes the block size and total/free blocks in a file system volume.

This replaces two older OSAL calls:

OS\_fsBlocksFree() is determined by reading the blocks\_free output struct member OS\_fsBytesFree() is determined by multiplying blocks\_free by the block\_size member

## **Parameters**

	in	name	The device/path to operate on (must not be null)
Γ	out	statbuf	Output structure to populate (must not be null)

## Returns

Execution status, see OSAL Return Code Defines

#### Return values

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if name or statbuf is NULL
OS_FS_ERR_PATH_TOO_LONG	if the name is too long
OS_ERROR	if an unexpected/unhandled OS error occurs (return value only verified in coverage test)

# **5.14.2.4 OS\_FS\_GetPhysDriveName()** int32 OS\_FS\_GetPhysDriveName (

```
char * PhysDriveName,
const char * MountPoint )
```

Obtains the physical drive name associated with a mount point.

Returns the name of the physical volume associated with the drive, when given the OSAL mount point of the drive

#### **Parameters**

out	PhysDriveName	Buffer to store physical drive name (must not be null)
in	MountPoint	OSAL mount point (must not be null)

## Returns

Execution status, see OSAL Return Code Defines

#### Return values

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if either parameter is NULL
OS_ERR_NAME_NOT_FOUND	if the MountPoint is not mounted in OSAL
OS_FS_ERR_PATH_TOO_LONG	if the MountPoint is too long

Returns information about the file system.

Returns information about the file system in an os\_fsinfo\_t. This includes the number of open files and file systems

## **Parameters**

out	filesys_info	Buffer to store filesystem information (must not be null)
-----	--------------	---

# Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if filesys_info is NULL

Initializes an existing file system.

Initializes a file system on the target.

#### Note

The "volname" parameter of RAM disks should always begin with the string "RAM", e.g. "RAMDISK" or "RA ← M0", "RAM1", etc if multiple devices are created. The underlying implementation uses this to select the correct filesystem type/format, and this may also be used to differentiate between RAM disks and real physical disks.

## **Parameters**

in	address	The address at which to start the new disk. If address == 0, then space will be allocated by	
		the OS	
in	devname	The underlying kernel device to use, if applicable. (must not be null)	
in	volname	The name of the volume (see note) (must not be null)	
in	blocksize	The size of a single block on the drive	
in	numblocks	The number of blocks to allocate for the drive	

## Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if devname or volname are NULL
OS_FS_ERR_PATH_TOO_LONG	if the name is too long
OS_FS_ERR_DEVICE_NOT_FREE	if the volume table is full
OS_FS_ERR_DRIVE_NOT_CREATED	if an unexpected/unhandled OS error occurs (return value only verified in coverage test)

```
const char * volname,
size_t blocksize,
osal_blockcount_t numblocks )
```

Makes a file system on the target.

Makes a file system on the target. Highly dependent on underlying OS and dependent on OS volume table definition.

#### Note

The "volname" parameter of RAM disks should always begin with the string "RAM", e.g. "RAMDISK" or "RA ← M0", "RAM1", etc if multiple devices are created. The underlying implementation uses this to select the correct filesystem type/format, and this may also be used to differentiate between RAM disks and real physical disks.

## **Parameters**

in	address	The address at which to start the new disk. If address == 0 space will be allocated by the OS.
in	devname	The underlying kernel device to use, if applicable. (must not be null)
in	volname	The name of the volume (see note) (must not be null)
in	blocksize	The size of a single block on the drive
in	numblocks	The number of blocks to allocate for the drive

#### Returns

Execution status, see OSAL Return Code Defines

#### **Return values**

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if devname or volname is NULL
OS_FS_ERR_PATH_TOO_LONG	if the overall devname or volname is too long
OS_FS_ERR_DEVICE_NOT_FREE	if the volume table is full
OS_FS_ERR_DRIVE_NOT_CREATED	if an unexpected/unhandled OS error occurs (return value only verified in coverage test)

Mounts a file system.

Mounts a file system / block device at the given mount point.

in	devname	The name of the drive to mount. devname is the same from OS_mkfs (must not be null)	
in	mountpoint	The name to call this disk from now on (must not be null)	

## Returns

Execution status, see OSAL Return Code Defines

## **Return values**

OS_SUCCESS	Successful execution.
OS_ERR_NAME_NOT_FOUND	if the device name does not exist in OSAL
OS_FS_ERR_PATH_TOO_LONG	if the mount point string is too long
OS_INVALID_POINTER	if any argument is NULL
OS_ERROR	if an unexpected/unhandled OS error occurs (return value only verified in
	coverage test)

```
5.14.2.9 OS_rmfs() int32 OS_rmfs ( const char * devname)
```

Removes a file system.

This function will remove or un-map the target file system. Note that this is not the same as un-mounting the file system.

## **Parameters**

in	devname	The name of the "generic" drive (must not be null)
----	---------	--

## Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if devname is NULL
OS_FS_ERR_PATH_TOO_LONG	if the devname is too long
OS_ERR_NAME_NOT_FOUND	if the devname does not exist in OSAL
OS_ERROR	if an unexpected/unhandled OS error occurs (return value only verified in coverage test)

Translates an OSAL Virtual file system path to a host Local path.

Translates a virtual path to an actual system path name

## Note

The buffer provided in the LocalPath argument is required to be at least OS\_MAX\_PATH\_LEN characters in length.

#### **Parameters**

in	VirtualPath	OSAL virtual path name (must not be null)
out	LocalPath	Buffer to store native/translated path name (must not be null)

## Returns

Execution status, see OSAL Return Code Defines

# Return values

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if either parameter is NULL
OS_FS_ERR_NAME_TOO_LONG	if the filename component is too long
OS_FS_ERR_PATH_INVALID	if either parameter cannot be interpreted as a path
OS_FS_ERR_PATH_TOO_LONG	if either input or output pathnames are too long

```
5.14.2.11 OS_unmount() int32 OS_unmount ( const char * mountpoint )
```

Unmounts a mounted file system.

This function will unmount a drive from the file system and make all open file descriptors useless.

## Note

Any open file descriptors referencing this file system should be closed prior to unmounting a drive

# **Parameters**

in	mountpoint	The mount point to remove from OS_mount (must not be null)
		The meant point to remove mean object (mast not be main)

## Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if name is NULL
OS_FS_ERR_PATH_TOO_LONG	if the absolute path given is too long
OS_ERR_NAME_NOT_FOUND	if the mountpoint is not mounted in OSAL
OS_ERROR	if an unexpected/unhandled OS error occurs (return value only verified in
	coverage test)

# 5.15 OSAL Heap APIs

## **Functions**

• int32 OS\_HeapGetInfo (OS\_heap\_prop\_t \*heap\_prop)

Return current info on the heap.

# 5.15.1 Detailed Description

## 5.15.2 Function Documentation

```
5.15.2.1 OS_HeapGetInfo() int32 OS_HeapGetInfo ( OS_heap_prop_t * heap_prop_)
```

Return current info on the heap.

## **Parameters**

out	heap_prop	Storage buffer for heap info
-----	-----------	------------------------------

# Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if the heap_prop argument is NULL

# 5.16 OSAL Object Type Defines

#### Macros

# 5.17 OSAL Object ID Utility APIs

#### **Functions**

static unsigned long OS ObjectIdToInteger (osal id t object id)

Obtain an integer value corresponding to an object ID.

static osal\_id\_t OS\_ObjectIdFromInteger (unsigned long value)

Obtain an osal ID corresponding to an integer value.

static bool OS\_ObjectIdEqual (osal\_id\_t object\_id1, osal\_id\_t object\_id2)

Check two OSAL object ID values for equality.

static bool OS\_ObjectIdDefined (osal\_id\_t object\_id)

Check if an object ID is defined.

int32 OS GetResourceName (osal id t object id, char \*buffer, size t buffer size)

Obtain the name of an object given an arbitrary object ID.

osal objtype t OS IdentifyObject (osal id t object id)

Obtain the type of an object given an arbitrary object ID.

int32 OS ConvertToArrayIndex (osal id t object id, osal index t \*ArrayIndex)

Converts an abstract ID into a number suitable for use as an array index.

int32 OS\_ObjectIdToArrayIndex (osal\_objtype\_t idtype, osal\_id\_t object\_id, osal\_index\_t \*ArrayIndex)

Converts an abstract ID into a number suitable for use as an array index.

void OS\_ForEachObject (osal\_id\_t creator\_id, OS\_ArgCallback\_t callback\_ptr, void \*callback\_arg)

call the supplied callback function for all valid object IDs

 void OS\_ForEachObjectOfType (osal\_objtype\_t objtype, osal\_id\_t creator\_id, OS\_ArgCallback\_t callback\_ptr, void \*callback\_arg)

call the supplied callback function for valid object IDs of a specific type

#### 5.17.1 Detailed Description

#### 5.17.2 Function Documentation

```
5.17.2.1 OS_ConvertToArrayIndex() int32 OS_ConvertToArrayIndex ( osal_id_t object_id, osal_index_t * ArrayIndex )
```

Converts an abstract ID into a number suitable for use as an array index.

This will return a unique zero-based integer number in the range of [0,MAX) for any valid object ID. This may be used by application code as an array index for indexing into local tables.

Note

This does NOT verify the validity of the ID, that is left to the caller. This is only the conversion logic.

This routine accepts any object type, and returns a value based on the maximum number of objects for that type. This is equivalent to invoking OS\_ObjectIdToArrayIndex() with the idtype set to OS\_OBJECT\_TYPE\_UNDEFINED.

See also

OS ObjectIdToArrayIndex

in	object_id	The object ID to operate on
out	*ArrayIndex	The Index to return (must not be null)

## Returns

Execution status, see OSAL Return Code Defines

## **Return values**

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	if the object_id argument is not valid
OS_INVALID_POINTER	if the ArrayIndex is NULL

call the supplied callback function for all valid object IDs

Loops through all defined OSAL objects of all types and calls callback\_ptr on each one If creator\_id is nonzero then only objects with matching creator id are processed.

#### **Parameters**

in	creator_id	Filter objects to those created by a specific task This may be passed as OS_OBJECT_CREATOR_ANY to return all objects	
in	callback_ptr	Function to invoke for each matching object ID	
in	callback_arg	Opaque Argument to pass to callback function (may be NULL)	

call the supplied callback function for valid object IDs of a specific type

Loops through all defined OSAL objects of a specific type and calls callback\_ptr on each one If creator\_id is nonzero then only objects with matching creator id are processed.

in	objtype	The type of objects to iterate	
in	creator_id	Filter objects to those created by a specific task This may be passed as OS_OBJECT_CREATOR_ANY to return all objects	
in	callback_ptr	Function to invoke for each matching object ID	
in	callback_arg	arg Opaque Argument to pass to callback function (may be NULL)	

Obtain the name of an object given an arbitrary object ID.

All OSAL resources generally have a name associated with them. This allows application code to retrieve the name of any valid OSAL object ID.

## **Parameters**

in	object_id	The object ID to operate on
out	buffer	Buffer in which to store the name (must not be null)
in	buffer_size	Size of the output storage buffer (must not be zero)

#### Returns

Execution status, see OSAL Return Code Defines

## **Return values**

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	if the passed-in ID is not a valid OSAL ID
OS_INVALID_POINTER	if the passed-in buffer is invalid
OS_ERR_NAME_TOO_LONG	if the name will not fit in the buffer provided

```
5.17.2.5 OS_IdentifyObject() osal_objtype_t OS_IdentifyObject ( osal_id_t object_id )
```

Obtain the type of an object given an arbitrary object ID.

Given an arbitrary object ID, get the type of the object

in	object⊷	The object ID to operate on
	_id	

## Returns

The object type portion of the object\_id, see OSAL Object Type Defines for expected values

```
5.17.2.6 OS_ObjectIdDefined() static bool OS_ObjectIdDefined ( osal_id_t object_id ) [inline], [static]
```

Check if an object ID is defined.

The OSAL ID values should be treated as abstract values by applications, and not directly manipulated using standard C operators.

This returns false if the ID is NOT a defined resource (i.e. free/empty/invalid).

Note

OS\_ObjectIdDefined(OS\_OBJECT\_ID\_UNDEFINED) is always guaranteed to be false.

#### **Parameters**

in	object⊷	The first object ID
	_id	

Definition at line 150 of file osapi-idmap.h.

References OS\_ObjectIdToInteger().

Check two OSAL object ID values for equality.

The OSAL ID values should be treated as abstract values by applications, and not directly manipulated using standard C operators.

This checks two values for equality, replacing the "==" operator.

in	object_id1	The first object ID
in	object_id2	The second object ID

#### Returns

true if the object IDs are equal

Definition at line 129 of file osapi-idmap.h.

References OS\_ObjectIdToInteger().

```
5.17.2.8 OS_ObjectIdFromInteger() static osal_id_t OS_ObjectIdFromInteger ( unsigned long value ) [inline], [static]
```

Obtain an osal ID corresponding to an integer value.

Provides the inverse of OS\_ObjectIdToInteger(). Reconstitutes the original osal\_id\_t type from an integer representation.

## **Parameters**

	in	value	The integer representation of an OSAL ID	
--	----	-------	--	--

#### Returns

The ID value converted to an osal id t

Definition at line 102 of file osapi-idmap.h.

Converts an abstract ID into a number suitable for use as an array index.

This will return a unique zero-based integer number in the range of [0,MAX) for any valid object ID. This may be used by application code as an array index for indexing into local tables.

This routine operates on a specific object type, and returns a value based on the maximum number of objects for that type.

If the idtype is passed as OS\_OBJECT\_TYPE\_UNDEFINED, then object type verification is skipped and any object ID will be accepted and converted to an index. In this mode, the range of the output depends on the actual passed-in object type.

If the idtype is passed as any other value, the passed-in ID value is first confirmed to be the correct type. This check will guarantee that the output is within an expected range; for instance, if the type is passed as OS\_OBJECT\_TYPE\_OS\_TASK, then the output index is guaranteed to be between 0 and OS\_MAX\_TASKS-1 after successful conversion.

#### **Parameters**

in	idtype	The object type to convert
in	object_id	The object ID to operate on
out *ArrayIndex		The Index to return (must not be null)

#### Returns

Execution status, see OSAL Return Code Defines

#### **Return values**

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	if the object_id argument is not valid
OS_INVALID_POINTER	if the ArrayIndex is NULL

```
5.17.2.10 OS_ObjectIdToInteger() static unsigned long OS_ObjectIdToInteger ( osal_id_t object_id ) [inline], [static]
```

Obtain an integer value corresponding to an object ID.

Obtains an integer representation of an object id, generally for the purpose of printing to the console or system logs.

The returned value is of the type "unsigned long" for direct use with printf-style functions. It is recommended to use the "%|x" conversion specifier as the hexadecimal encoding clearly delineates the internal fields.

## Note

This provides the raw integer value and is *not* suitable for use as an array index, as the result is not zero-based. See the OS\_ConvertToArrayIndex() to obtain a zero-based index value.

#### **Parameters**

in	object⊷	The object ID
	_id	

## Returns

integer value representation of object ID

Definition at line 80 of file osapi-idmap.h.

Referenced by OS\_ObjectIdDefined(), and OS\_ObjectIdEqual().

# 5.18 OSAL Dynamic Loader and Symbol APIs

#### **Functions**

- int32 OS\_SymbolLookup (cpuaddr \*symbol\_address, const char \*symbol\_name)
   Find the Address of a Symbol.
- int32 OS\_ModuleSymbolLookup (osal\_id\_t module\_id, cpuaddr \*symbol\_address, const char \*symbol\_name)

  Find the Address of a Symbol within a module.
- int32 OS\_SymbolTableDump (const char \*filename, size\_t size\_limit)

Dumps the system symbol table to a file.

- int32 OS\_ModuleLoad (osal\_id\_t \*module\_id, const char \*module\_name, const char \*filename, uint32 flags)

  Loads an object file.
- int32 OS\_ModuleUnload (osal\_id\_t module\_id)

Unloads the module file.

• int32 OS\_ModuleInfo (osal\_id\_t module\_id, OS\_module\_prop\_t \*module\_info)

Obtain information about a module.

## 5.18.1 Detailed Description

#### 5.18.2 Function Documentation

Obtain information about a module.

Returns information about the loadable module

#### **Parameters**

in	module_id	OSAL ID of the previously the loaded module
out	module_info	Buffer to store module information (must not be null)

#### Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.	
OS_ERR_INVALID_ID	if the module id invalid	
OS_INVALID_POINTER   if the pointer to the ModuleInfo structure is invalid		
OS_ERROR	if an other/unspecified error occurs (return value only verified in coverage test)	

Loads an object file.

Loads an object file into the running operating system

The "flags" parameter may influence how the loaded module symbols are made available for use in the application. See OS\_MODULE\_FLAG\_LOCAL\_SYMBOLS and OS\_MODULE\_FLAG\_GLOBAL\_SYMBOLS for descriptions.

#### **Parameters**

	out	module_id	Non-zero OSAL ID corresponding to the loaded module
	in	module_name	Name of module (must not be null)
	in	filename	File containing the object code to load (must not be null)
ľ	in	flags	Options for the loaded module

## Returns

Execution status, see OSAL Return Code Defines

## **Return values**

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if one of the parameters is NULL
OS_ERR_NO_FREE_IDS	if the module table is full
OS_ERR_NAME_TAKEN	if the name is in use
OS_ERR_NAME_TOO_LONG	if the module_name is too long
OS_FS_ERR_PATH_INVALID	if the filename argument is not valid
OS_ERROR	if an other/unspecified error occurs (return value only verified in coverage test)

Find the Address of a Symbol within a module.

This is similar to OS\_SymbolLookup() but for a specific module ID. This should be used to look up a symbol in a module that has been loaded with the OS\_MODULE\_FLAG\_LOCAL\_SYMBOLS flag.

in	module_id	Module ID that should contain the symbol
out	symbol_address	Set to the address of the symbol (must not be null)
in	symbol_name	Name of the symbol to look up (must not be null)

## Returns

Execution status, see OSAL Return Code Defines

#### **Return values**

OS_SUCCESS	Successful execution.
OS_ERROR	if the symbol could not be found
OS_INVALID_POINTER	if one of the pointers passed in are NULL

# **5.18.2.4 OS\_ModuleUnload()** int32 OS\_ModuleUnload ( osal\_id\_t module\_id )

Unloads the module file.

Unloads the module file from the running operating system

## **Parameters**

in	module↔	OSAL ID of the previously the loaded module
	_id	

## Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.	
OS_ERR_INVALID_ID	if the module id invalid	
OS_ERROR	if an other/unspecified error occurs (return value only verified in coverage test)	

Find the Address of a Symbol.

This calls to the OS dynamic symbol lookup implementation, and/or checks a static symbol table for a matching symbol name.

The static table is intended to support embedded targets that do not have module loading capability or have it disabled.

#### **Parameters**

out	symbol_address	Set to the address of the symbol (must not be null)
in	symbol_name	Name of the symbol to look up (must not be null)

## Returns

Execution status, see OSAL Return Code Defines

#### **Return values**

OS_SUCCESS	Successful execution.
OS_ERROR	if the symbol could not be found
OS_INVALID_POINTER	if one of the pointers passed in are NULL

Dumps the system symbol table to a file.

Dumps the system symbol table to the specified filename

#### Note

Not all RTOS implementations support this API. If the underlying module subsystem does not provide a facility to iterate through the symbol table, then the OS\_ERR\_NOT\_IMPLEMENTED status code is returned.

#### **Parameters**

in	filename	File to write to (must not be null)
in	size_limit	Maximum number of bytes to write

#### Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.
OS_ERR_NOT_IMPLEMENTED	Not implemented.
OS_INVALID_POINTER	if the filename argument is NULL
OS_FS_ERR_PATH_INVALID	if the filename argument is not valid
OS_ERR_NAME_TOO_LONG	if any of the symbol names are too long (return value only verified in coverage test)
OS_ERR_OUTPUT_TOO_LARGE	if the size_limit was reached before completing all symbols (return value only verified in coverage test)
OS_ERROR	if an other/unspecified error occurs (return value only verified in coverage test)

## 5.19 OSAL Mutex APIs

## **Functions**

• int32 OS\_MutSemCreate (osal\_id\_t \*sem\_id, const char \*sem\_name, uint32 options)

Creates a mutex semaphore.

int32 OS\_MutSemGive (osal\_id\_t sem\_id)

Releases the mutex object referenced by sem\_id.

int32 OS\_MutSemTake (osal\_id\_t sem\_id)

Acquire the mutex object referenced by sem\_id.

int32 OS\_MutSemDelete (osal\_id\_t sem\_id)

Deletes the specified Mutex Semaphore.

int32 OS\_MutSemGetIdByName (osal\_id\_t \*sem\_id, const char \*sem\_name)

Find an existing mutex ID by name.

• int32 OS\_MutSemGetInfo (osal\_id\_t sem\_id, OS\_mut\_sem\_prop\_t \*mut\_prop)

Fill a property object buffer with details regarding the resource.

## 5.19.1 Detailed Description

#### 5.19.2 Function Documentation

Creates a mutex semaphore.

Mutex semaphores are always created in the unlocked (full) state.

## **Parameters**

out	sem_id	will be set to the non-zero ID of the newly-created resource (must not be null)
in	sem_name	the name of the new resource to create (must not be null)
in	options	reserved for future use. Should be passed as 0.

#### Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.

5.19 OSAL Mutex APIs 103

#### Return values

OS_INVALID_POINTER	if sem_id or sem_name are NULL
OS_ERR_NAME_TOO_LONG	name length including null terminator greater than OS_MAX_API_NAME
OS_ERR_NO_FREE_IDS	if there are no more free mutex lds
OS_ERR_NAME_TAKEN	if there is already a mutex with the same name
OS_SEM_FAILURE	if the OS call failed (return value only verified in coverage test)

```
5.19.2.2 OS_MutSemDelete() int32 OS_MutSemDelete ( osal_id_t sem_id )
```

Deletes the specified Mutex Semaphore.

Delete the semaphore. This also frees the respective sem\_id such that it can be used again when another is created.

## **Parameters**

in	sem⊷	The object ID to delete
	_id	

## Returns

Execution status, see OSAL Return Code Defines

## Return values

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	if the id passed in is not a valid mutex
OS_SEM_FAILURE	if an unspecified error occurs (return value only verified in coverage test)

```
5.19.2.3 OS_MutSemGetIdByName() int32 OS_MutSemGetIdByName ( osal_id_t * sem_id, const char * sem_name )
```

Find an existing mutex ID by name.

This function tries to find a mutex sem Id given the name of a mut\_sem. The id is returned through sem\_id

## **Parameters**

out	sem_id	will be set to the ID of the existing resource
in	sem_name	the name of the existing resource to find (must not be null)

#### Returns

Execution status, see OSAL Return Code Defines

#### **Return values**

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	is semid or sem_name are NULL pointers
OS_ERR_NAME_TOO_LONG	name length including null terminator greater than OS_MAX_API_NAME
OS_ERR_NAME_NOT_FOUND	if the name was not found in the table

Fill a property object buffer with details regarding the resource.

This function will pass back a pointer to structure that contains all of the relevant info( name and creator) about the specified mutex semaphore.

#### **Parameters**

in	sem_id	The object ID to operate on
out	mut_prop	The property object buffer to fill (must not be null)

## Returns

Execution status, see OSAL Return Code Defines

## **Return values**

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	if the id passed in is not a valid semaphore
OS_INVALID_POINTER	if the mut_prop pointer is null

Releases the mutex object referenced by sem\_id.

If there are threads blocked on the mutex object referenced by mutex when this function is called, resulting in the mutex becoming available, the scheduling policy shall determine which thread shall acquire the mutex.

5.19 OSAL Mutex APIs 105

#### **Parameters**

in	sem←	The object ID to operate on
	_id	

## Returns

Execution status, see OSAL Return Code Defines

## **Return values**

OS_SUCCESS	SS Successful execution.	
OS_ERR_INVALID_ID	if the id passed in is not a valid mutex	
OS_SEM_FAILURE	if an unspecified error occurs (return value only verified in coverage test)	

# **5.19.2.6 OS\_MutSemTake()** int32 OS\_MutSemTake ( osal\_id\_t sem\_id )

Acquire the mutex object referenced by sem\_id.

If the mutex is already locked, the calling thread shall block until the mutex becomes available. This operation shall return with the mutex object referenced by mutex in the locked state with the calling thread as its owner.

## **Parameters**

in	sem⊷	The object ID to operate on
	_id	

## Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.	
OS_ERR_INVALID_ID	the id passed in is not a valid mutex	
OS_SEM_FAILURE	if an unspecified error occurs (return value only verified in coverage test)	

## 5.20 OSAL Network ID APIs

Provides some basic methods to query a network host name and ID.

## **Functions**

int32 OS\_NetworkGetID (void)

Gets the network ID of the local machine.

int32 OS\_NetworkGetHostName (char \*host\_name, size\_t name\_len)

Gets the local machine network host name.

## 5.20.1 Detailed Description

Provides some basic methods to query a network host name and ID.

## 5.20.2 Function Documentation

Gets the local machine network host name.

If configured in the underlying network stack, this function retrieves the local hostname of the system.

## **Parameters**

out	host_name	Buffer to hold name information (must not be null)
in	name_len	Maximum length of host name buffer (must not be zero)

## Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_SIZE	if the name_len is zero
OS_INVALID_POINTER	if the host_name is NULL

```
5.20.2.2 OS_NetworkGetID() int32 OS_NetworkGetID ( void )
```

Gets the network ID of the local machine.

The ID is an implementation-defined value and may not be consistent in meaning across different platform types.

#### Note

This API may be removed in a future version of OSAL due to inconsistencies between platforms.

## Returns

The ID or fixed value of -1 if the host id could not be found. Note it is not possible to differentiate between error codes and valid network IDs here. It is assumed, however, that -1 is never a valid ID.

## 5.21 OSAL Printf APIs

#### **Functions**

```
    void OS_printf (const char *string,...) OS_PRINTF(1
        Abstraction for the system printf() call.
```

void void OS\_printf\_disable (void)

This function disables the output from OS\_printf.

void OS\_printf\_enable (void)

This function enables the output from OS\_printf.

## 5.21.1 Detailed Description

#### 5.21.2 Function Documentation

Abstraction for the system printf() call.

This function abstracts out the printf type statements. This is useful for using OS- specific thats that will allow non-polled print statements for the real time systems.

Operates in a manner similar to the printf() call defined by the standard C library and takes all the parameters and formatting options of printf. This abstraction may implement additional buffering, if necessary, to improve the real-time performance of the call.

Strings (including terminator) longer than OS BUFFER SIZE will be truncated.

The output of this routine also may be dynamically enabled or disabled by the OS\_printf\_enable() and OS\_printf\_disable() calls, respectively.

## **Parameters**

```
in string Format string, followed by additional arguments
```

```
5.21.2.2 OS_printf_disable() void void OS_printf_disable ( void )
```

This function disables the output from OS printf.

5.21 OSAL Printf APIs 109

```
5.21.2.3 OS_printf_enable() void OS_printf_enable ( void )
```

This function enables the output from OS\_printf.

# 5.22 OSAL Message Queue APIs

#### **Functions**

int32 OS\_QueueCreate (osal\_id\_t \*queue\_id, const char \*queue\_name, osal\_blockcount\_t queue\_depth, size
 —t data\_size, uint32 flags)

Create a message queue.

int32 OS QueueDelete (osal id t queue id)

Deletes the specified message queue.

int32 OS\_QueueGet (osal\_id\_t queue\_id, void \*data, size\_t size, size\_t \*size\_copied, int32 timeout)

Receive a message on a message queue.

• int32 OS\_QueuePut (osal\_id\_t queue\_id, const void \*data, size\_t size, uint32 flags)

Put a message on a message queue.

• int32 OS\_QueueGetIdByName (osal\_id\_t \*queue\_id, const char \*queue\_name)

Find an existing queue ID by name.

• int32 OS\_QueueGetInfo (osal\_id\_t queue\_id, OS\_queue\_prop\_t \*queue\_prop)

Fill a property object buffer with details regarding the resource.

## 5.22.1 Detailed Description

#### 5.22.2 Function Documentation

Create a message queue.

This is the function used to create a queue in the operating system. Depending on the underlying operating system, the memory for the queue will be allocated automatically or allocated by the code that sets up the queue. Queue names must be unique; if the name already exists this function fails. Names cannot be NULL.

#### **Parameters**

out	queue_id	will be set to the non-zero ID of the newly-created resource (must not be null)
in	queue_name	the name of the new resource to create (must not be null)
in	queue_depth	the maximum depth of the queue
in	data_size	the size of each entry in the queue (must not be zero)
in	flags	options for the queue (reserved for future use, pass as 0)

#### Returns

Execution status, see OSAL Return Code Defines

#### **Return values**

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if a pointer passed in is NULL
OS_ERR_NAME_TOO_LONG	name length including null terminator greater than OS_MAX_API_NAME
OS_ERR_NO_FREE_IDS	if there are already the max queues created
OS_ERR_NAME_TAKEN	if the name is already being used on another queue
OS_ERR_INVALID_SIZE	if data_size is 0
OS_QUEUE_INVALID_SIZE	if the queue depth exceeds the limit
OS_ERROR	if the OS create call fails

# **5.22.2.2 OS\_QueueDelete()** int32 OS\_QueueDelete ( osal\_id\_t queue\_id )

Deletes the specified message queue.

This is the function used to delete a queue in the operating system. This also frees the respective queue\_id to be used again when another queue is created.

## Note

If There are messages on the queue, they will be lost and any subsequent calls to QueueGet or QueuePut to this queue will result in errors

#### **Parameters**

in	queue⊷	The object ID to delete
	_id	

## Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	if the id passed in does not exist
OS_ERROR	if the OS call returns an unexpected error (return value only verified in coverage test)

Receive a message on a message queue.

If a message is pending, it is returned immediately. Otherwise the calling task will block until a message arrives or the timeout expires.

#### **Parameters**

in	queue_id	The object ID to operate on
out	data	The buffer to store the received message (must not be null)
in	size	The size of the data buffer (must not be zero)
out	size_copied	Set to the actual size of the message (must not be null)
in	timeout	The maximum amount of time to block, or OS_PEND to wait forever

## Returns

Execution status, see OSAL Return Code Defines

## Return values

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	if the given ID does not exist
OS_INVALID_POINTER	if a pointer passed in is NULL
OS_QUEUE_EMPTY	if the Queue has no messages on it to be received
OS_QUEUE_TIMEOUT	if the timeout was OS_PEND and the time expired
OS_QUEUE_INVALID_SIZE	if the size copied from the queue was not correct
OS_ERROR	if the OS call returns an unexpected error (return value only verified in coverage test)

```
5.22.2.4 OS_QueueGetIdByName() int32 OS_QueueGetIdByName ( osal_id_t * queue_id, const char * queue_name )
```

Find an existing queue ID by name.

This function tries to find a queue Id given the name of the queue. The id of the queue is passed back in queue\_id.

## **Parameters**

out	queue_id	will be set to the ID of the existing resource
in	queue_name	the name of the existing resource to find (must not be null)

#### Returns

Execution status, see OSAL Return Code Defines

#### **Return values**

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if the name or id pointers are NULL
OS_ERR_NAME_TOO_LONG	name length including null terminator greater than OS_MAX_API_NAME
OS_ERR_NAME_NOT_FOUND	the name was not found in the table

Fill a property object buffer with details regarding the resource.

This function will pass back a pointer to structure that contains all of the relevant info (name and creator) about the specified queue.

## **Parameters**

in	queue_id	The object ID to operate on
out	queue_prop	The property object buffer to fill (must not be null)

#### Returns

Execution status, see OSAL Return Code Defines

#### **Return values**

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if queue_prop is NULL
OS_ERR_INVALID_ID	if the ID given is not a valid queue

Put a message on a message queue.

## **Parameters**

i	.n	queue←	The object ID to operate on
		_id	
i	.n	data	The buffer containing the message to put (must not be null)
i	.n	size	The size of the data buffer (must not be zero)
i	.n	flags	Currently reserved/unused, should be passed as 0

# Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	if the queue id passed in is not a valid queue
OS_INVALID_POINTER	if the data pointer is NULL
OS_QUEUE_INVALID_SIZE	if the data message is too large for the queue
OS_QUEUE_FULL	if the queue cannot accept another message
OS_ERROR	if the OS call returns an unexpected error (return value only verified in coverage test)

5.23 OSAL Select APIs 115

## 5.23 OSAL Select APIs

#### **Functions**

int32 OS SelectMultiple (OS FdSet \*ReadSet, OS FdSet \*WriteSet, int32 msecs)

Wait for events across multiple file handles.

• int32 OS\_SelectSingle (osal\_id\_t objid, uint32 \*StateFlags, int32 msecs)

Wait for events on a single file handle.

int32 OS\_SelectFdZero (OS\_FdSet \*Set)

Clear a FdSet structure.

int32 OS\_SelectFdAdd (OS\_FdSet \*Set, osal\_id\_t objid)

Add an ID to an FdSet structure.

int32 OS\_SelectFdClear (OS\_FdSet \*Set, osal\_id\_t objid)

Clear an ID from an FdSet structure.

bool OS\_SelectFdlsSet (const OS\_FdSet \*Set, osal\_id\_t objid)

Check if an FdSet structure contains a given ID.

## 5.23.1 Detailed Description

#### 5.23.2 Function Documentation

Add an ID to an FdSet structure.

After this call the set will contain the given OSAL ID

## **Parameters**

in,out	Set	Pointer to OS_FdSet object to operate on (must not be null)
in	objid	The handle ID to add to the set

## Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if argument is NULL
OS_ERR_INVALID_ID	if the objid is not a valid handle

Clear an ID from an FdSet structure.

After this call the set will no longer contain the given OSAL ID

## **Parameters**

in,out	Set	Pointer to OS_FdSet object to operate on (must not be null)
in	objid	The handle ID to remove from the set

## Returns

Execution status, see OSAL Return Code Defines

#### Return values

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if argument is NULL
OS_ERR_INVALID_ID	if the objid is not a valid handle

Check if an FdSet structure contains a given ID.

## **Parameters**

in	Set	Pointer to OS_FdSet object to operate on (must not be null)
in	objid	The handle ID to check for in the set

## Returns

Boolean set status

true	FdSet structure contains ID
false	FDSet structure does not contain ID

5.23 OSAL Select APIs 117

```
5.23.2.4 OS_SelectFdZero() int32 OS_SelectFdZero ( OS_FdSet * Set )
```

Clear a FdSet structure.

After this call the set will contain no OSAL IDs

#### **Parameters**

out	Set	Pointer to OS_	FdSet object to clear (	must not be null)
-----	-----	----------------	-------------------------	-------------------

#### Returns

Execution status, see OSAL Return Code Defines

#### Return values

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if argument is NULL

Wait for events across multiple file handles.

Wait for any of the given sets of IDs to become readable or writable

This function will block until any of the following occurs:

- · At least one OSAL ID in the ReadSet is readable
- · At least one OSAL ID in the WriteSet is writable
- · The timeout has elapsed

The sets are input/output parameters. On entry, these indicate the file handle(s) to wait for. On exit, these are set to the actual file handle(s) that have activity.

If the timeout occurs this returns an error code and all output sets should be empty.

## Note

This does not lock or otherwise protect the file handles in the given sets. If a filehandle supplied via one of the FdSet arguments is closed or modified by another while this function is in progress, the results are undefined. Because of this limitation, it is recommended to use OS\_SelectSingle() whenever possible.

#### **Parameters**

in,out	ReadSet	Set of handles to check/wait to become readable
in,out	WriteSet	Set of handles to check/wait to become writable
in	msecs	Indicates the timeout. Positive values will wait up to that many milliseconds. Zero will not wait (poll). Negative values will wait forever (pend)

## Returns

Execution status, see OSAL Return Code Defines

#### Return values

OS_SUCCESS	If any handle in the ReadSet or WriteSet is readable or writable, respectively
OS_ERROR_TIMEOUT	If no handles in the ReadSet or WriteSet became readable or
	writable within the timeout
OS_ERR_OPERATION_NOT_SUPPORTED	if a specified handle does not support select
OS_ERR_INVALID_ID	if no valid handles were contained in the ReadSet/WriteSet

Wait for events on a single file handle.

Wait for a single OSAL filehandle to change state

This function can be used to wait for a single OSAL stream ID to become readable or writable. On entry, the "StateFlags" parameter should be set to the desired state (OS\_STREAM\_STATE\_READABLE and/or OS\_STREAM\_STATE\_WR UTABLE) and upon return the flags will be set to the state actually detected.

As this operates on a single ID, the filehandle is protected during this call, such that another thread accessing the same handle will return an error. However, it is important to note that once the call returns then other threads may then also read/write and affect the state before the current thread can service it.

To mitigate this risk the application may prefer to use the OS\_TimedRead/OS\_TimedWrite calls.

## **Parameters**

	in	objid	The handle ID to select on
ſ	in,out	StateFlags	State flag(s) (readable or writable) (must not be null)
ſ	in	msecs	Indicates the timeout. Positive values will wait up to that many milliseconds. Zero will
			not wait (poll). Negative values will wait forever (pend)

5.23 OSAL Select APIs 119

## Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	If the handle is readable and/or writable, as requested
OS_ERROR_TIMEOUT	If the handle did not become readable or writable within the timeout
OS_INVALID_POINTER	if argument is NULL
OS_ERR_INVALID_ID	if the objid is not a valid handle

## 5.24 OSAL Shell APIs

#### **Functions**

• int32 OS\_ShellOutputToFile (const char \*Cmd, osal\_id\_t filedes)

Executes the command and sends output to a file.

## 5.24.1 Detailed Description

## 5.24.2 Function Documentation

Executes the command and sends output to a file.

Takes a shell command in and writes the output of that command to the specified file The output file must be opened previously with write access (OS\_WRITE\_ONLY or OS\_READ\_WRITE).

## **Parameters**

in	Cmd	Command to pass to shell (must not be null)
in	filedes	File to send output to.

## Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.
OS_ERROR	if the command was not executed properly
OS_INVALID_POINTER	if Cmd argument is NULL
OS_ERR_INVALID_ID	if the file descriptor passed in is invalid

## 5.25 OSAL Socket Address APIs

These functions provide a means to manipulate network addresses in a manner that is (mostly) agnostic to the actual network address type.

#### **Functions**

- $\bullet \ \ int 32\ OS\_Socket Addr Init\ (OS\_Sock Addr\_t\ *Addr,\ OS\_Socket Domain\_t\ Domain)\\$ 
  - Initialize a socket address structure to hold an address of the given family.
- int32 OS\_SocketAddrToString (char \*buffer, size\_t buflen, const OS\_SockAddr\_t \*Addr)

Get a string representation of a network host address.

int32 OS\_SocketAddrFromString (OS\_SockAddr\_t \*Addr, const char \*string)

Set a network host address from a string representation.

int32 OS\_SocketAddrGetPort (uint16 \*PortNum, const OS\_SockAddr\_t \*Addr)

Get the port number of a network address.

int32 OS\_SocketAddrSetPort (OS\_SockAddr\_t \*Addr, uint16 PortNum)

Set the port number of a network address.

#### 5.25.1 Detailed Description

These functions provide a means to manipulate network addresses in a manner that is (mostly) agnostic to the actual network address type.

Every network address should be representable as a string (i.e. dotted decimal IP, etc). This can serve as the "common denominator" to all address types.

#### 5.25.2 Function Documentation

Set a network host address from a string representation.

The specific format of the output string depends on the address family.

The address structure should have been previously initialized using OS\_SocketAddrInit() to set the address family type.

Note

For IPv4, this would typically be the dotted-decimal format (X.X.X.X). It is up to the discretion of the underlying implementation whether to accept hostnames, as this depends on the availability of DNS services. Since many embedded deployments do not have name services, this should not be relied upon.

#### **Parameters**

out	Addr	The address buffer to initialize (must not be null)
in	string	The string to initialize the address from (must not be null)

## Returns

Execution status, see OSAL Return Code Defines

## **Return values**

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if argument is NULL
OS_ERROR	if the string cannot be converted to an address

```
5.25.2.2 OS_SocketAddrGetPort() int32 OS_SocketAddrGetPort ( uint16 * PortNum, const OS_SockAddr_t * Addr )
```

Get the port number of a network address.

For network protocols that have the concept of a port number (such as TCP/IP and UDP/IP) this function gets the port number from the address structure.

## **Parameters**

out	PortNum	Buffer to store the port number (must not be null)
in	Addr	The network address buffer (must not be null)

## Returns

Execution status, see OSAL Return Code Defines

## Return values

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if argument is NULL
OS_ERR_BAD_ADDRESS	if the address domain is not compatible

## 5.25.2.3 OS\_SocketAddrInit() int32 OS\_SocketAddrInit (

```
OS_SockAddr_t * Addr,
OS_SocketDomain_t Domain )
```

Initialize a socket address structure to hold an address of the given family.

The address is set to a suitable default value for the family.

#### **Parameters**

out	Addr	The address buffer to initialize (must not be null)
in	Domain	The address family

## Returns

Execution status, see OSAL Return Code Defines

#### **Return values**

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if Addr argument is NULL
OS_ERR_NOT_IMPLEMENTED	if the system does not implement the requested domain

```
5.25.2.4 OS_SocketAddrSetPort() int32 OS_SocketAddrSetPort (
OS_SockAddr_t * Addr,
uint16 PortNum )
```

Set the port number of a network address.

For network protocols that have the concept of a port number (such as TCP/IP and UDP/IP) this function sets the port number from the address structure.

## **Parameters**

out	Addr	The network address buffer (must not be null)
in	PortNum	The port number to set

#### Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if argument is NULL
OS_ERR_BAD_ADDRESS	if the address domain is not compatible

Get a string representation of a network host address.

The specific format of the output string depends on the address family.

This string should be suitable to pass back into OS\_SocketAddrFromString() which should recreate the same network address, and it should also be meaningful to a user of printed or logged as a C string.

#### Note

For IPv4, this would typically be the dotted-decimal format (X.X.X.X).

## **Parameters**

out	buffer	Buffer to hold the output string (must not be null)
in	buflen	Maximum length of the output string (must not be zero)
in	Addr	The network address buffer to convert (must not be null)

## Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.	
OS_INVALID_POINTER	if argument is NULL	
OS_ERR_INVALID_SIZE	if passed-in buflen is not valid	
OS_ERROR	if the address cannot be converted to string, or string buffer too small	

## 5.26 OSAL Socket Management APIs

These functions are loosely related to the BSD Sockets API but made to be more consistent with other OSAL API functions. That is, they operate on OSAL IDs (32-bit opaque number values) and return an OSAL error code.

#### **Functions**

- int32 OS\_SocketOpen (osal\_id\_t \*sock\_id, OS\_SocketDomain\_t Domain, OS\_SocketType\_t Type)
   Opens a socket.
- int32 OS SocketBind (osal id t sock id, const OS SockAddr t \*Addr)

Binds a socket to a given local address and enter listening (server) mode.

int32 OS\_SocketListen (osal\_id\_t sock\_id)

Places the specified socket into a listening state.

int32 OS SocketBindAddress (osal id t sock id, const OS SockAddr t \*Addr)

Binds a socket to a given local address.

int32 OS SocketConnect (osal id t sock id, const OS SockAddr t \*Addr, int32 timeout)

Connects a socket to a given remote address.

• int32 OS\_SocketShutdown (osal\_id\_t sock\_id, OS\_SocketShutdownMode\_t Mode)

Implement graceful shutdown of a stream socket.

- int32 OS\_SocketAccept (osal\_id\_t sock\_id, osal\_id\_t \*connsock\_id, OS\_SockAddr\_t \*Addr, int32 timeout)
  - Waits for and accept the next incoming connection on the given socket.
- int32 OS\_SocketRecvFrom (osal\_id\_t sock\_id, void \*buffer, size\_t buflen, OS\_SockAddr\_t \*RemoteAddr, int32 timeout)

Reads data from a message-oriented (datagram) socket.

int32 OS\_SocketSendTo (osal\_id\_t sock\_id, const void \*buffer, size\_t buflen, const OS\_SockAddr\_t \*Remote←
 Addr)

Sends data to a message-oriented (datagram) socket.

int32 OS\_SocketGetIdByName (osal\_id\_t \*sock\_id, const char \*sock\_name)

Gets an OSAL ID from a given name.

int32 OS\_SocketGetInfo (osal\_id\_t sock\_id, OS\_socket\_prop\_t \*sock\_prop)

Gets information about an OSAL Socket ID.

#### 5.26.1 Detailed Description

These functions are loosely related to the BSD Sockets API but made to be more consistent with other OSAL API functions. That is, they operate on OSAL IDs (32-bit opaque number values) and return an OSAL error code.

OSAL Socket IDs are very closely related to File IDs and share the same ID number space. Additionally, the file OS\_read() / OS\_write() / OS\_close() calls also work on sockets.

Note that all of functions may return OS\_ERR\_NOT\_IMPLEMENTED if network support is not configured at compile time.

#### 5.26.2 Function Documentation

Waits for and accept the next incoming connection on the given socket.

This is used for sockets operating in a "server" role. The socket must be a stream type (connection-oriented) and previously bound to a local address using OS\_SocketBind(). This will block the caller up to the given timeout or until an incoming connection request occurs, whichever happens first.

The new stream connection is then returned to the caller and the original server socket ID can be reused for the next connection.

#### **Parameters**

in	sock_id	The server socket ID, previously bound using OS_SocketBind()
out	connsock↔ _id	The connection socket, a new ID that can be read/written (must not be null)
in	Addr	The remote address of the incoming connection (must not be null)
in	timeout	The maximum amount of time to wait, or OS_PEND to wait forever

#### Returns

Execution status, see OSAL Return Code Defines

#### **Return values**

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if argument is NULL
OS_ERR_INVALID_ID	if the sock_id parameter is not valid
OS_ERR_INCORRECT_OBJ_TYPE	if the handle is not a socket
OS_ERR_INCORRECT_OBJ_STATE	if the socket is not bound or already connected

```
5.26.2.2 OS_SocketBind() int32 OS_SocketBind ( osal_id_t sock_id, const OS_SockAddr_t * Addr )
```

Binds a socket to a given local address and enter listening (server) mode.

This is a convenience/compatibility routine to perform both OS\_SocketBindAddress() and OS\_SocketListen() operations in a single call, intended to simplify the setup for a server role.

If the socket is connectionless, then it only binds to the local address.

#### **Parameters**

in	sock⊷	The socket ID	
	_id		
in	Addr	The local address to bind to (must not be null)	

#### **Returns**

Execution status, see OSAL Return Code Defines

#### **Return values**

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	if the sock_id parameter is not valid
OS_INVALID_POINTER	if argument is NULL
OS_ERR_INCORRECT_OBJ_STATE	if the socket is already bound
OS_ERR_INCORRECT_OBJ_TYPE	if the handle is not a socket

```
5.26.2.3 OS_SocketBindAddress() int32 OS_SocketBindAddress ( osal_id_t sock_id, const OS_SockAddr_t * Addr )
```

Binds a socket to a given local address.

The specified socket will be bound to the local address and port, if available. This controls the source address reflected in network traffic transmitted via this socket.

After binding to the address, a stream socket may be followed by a call to either OS\_SocketListen() for a server role or to OS\_SocketConnect() for a client role.

#### **Parameters**

	in	sock⇔	The socket ID	
		_id		
İ	in	Addr	The local address to bind to (must not be null)	

#### Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	if the sock_id parameter is not valid

## **Return values**

OS_INVALID_POINTER	if argument is NULL
OS_ERR_INCORRECT_OBJ_STATE	if the socket is already bound
OS_ERR_INCORRECT_OBJ_TYPE	if the handle is not a socket

Connects a socket to a given remote address.

The socket will be connected to the remote address and port, if available. This only applies to stream-oriented sockets. Calling this on a datagram socket will return an error (these sockets should use SendTo/RecvFrom).

#### **Parameters**

in	sock⊷	The socket ID
	_id	
in	Addr	The remote address to connect to (must not be null)
in	timeout	The maximum amount of time to wait, or OS_PEND to wait forever

#### Returns

Execution status, see OSAL Return Code Defines

## **Return values**

OS_SUCCESS	Successful execution.
OS_ERR_INCORRECT_OBJ_STATE	if the socket is already connected
OS_ERR_INVALID_ID	if the sock_id parameter is not valid
OS_ERR_INCORRECT_OBJ_TYPE	if the handle is not a socket
OS_INVALID_POINTER	if Addr argument is NULL

```
5.26.2.5 OS_SocketGetIdByName() int32 OS_SocketGetIdByName ( osal_id_t * sock_id, const char * sock_name )
```

Gets an OSAL ID from a given name.

Note

OSAL Sockets use generated names according to the address and type.

#### See also

OS\_SocketGetInfo()

#### **Parameters**

out	sock_id	Buffer to hold result (must not be null)
in	sock_name	Name of socket to find (must not be null)

## Returns

Execution status, see OSAL Return Code Defines

#### **Return values**

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	is id or name are NULL pointers
OS_ERR_NAME_TOO_LONG	name length including null terminator greater than OS_MAX_API_NAME
OS_ERR_NAME_NOT_FOUND	if the name was not found in the table

Gets information about an OSAL Socket ID.

OSAL Sockets use generated names according to the address and type. This allows applications to find the name of a given socket.

## **Parameters**

in	sock_id	The socket ID
out	sock_prop	Buffer to hold socket information (must not be null)

## Returns

Execution status, see OSAL Return Code Defines

#### **Return values**

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	if the id passed in is not a valid semaphore
OS_INVALID_POINTER	if the count_prop pointer is null

```
5.26.2.7 OS_SocketListen() int32 OS_SocketListen ( osal_id_t sock_id )
```

Places the specified socket into a listening state.

This function only applies to connection-oriented (stream) sockets that are intended to be used in a server-side role. This places the socket into a state where it can accept incoming connections from clients.

## **Parameters**

in	sock⊷	The socket ID
	_id	

## Returns

Execution status, see OSAL Return Code Defines

## **Return values**

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	if the sock_id parameter is not valid
OS_ERR_INCORRECT_OBJ_STATE	if the socket is already listening
OS_ERR_INCORRECT_OBJ_TYPE	if the handle is not a stream socket

Opens a socket.

A new, unconnected and unbound socket is allocated of the given domain and type.

#### **Parameters**

out	sock↔	Buffer to hold the non-zero OSAL ID (must not be null)
	_id	
in	Domain	The domain / address family of the socket (INET or INET6, etc)
in	Туре	The type of the socket (STREAM or DATAGRAM)

#### Returns

Execution status, see OSAL Return Code Defines

#### **Return values**

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if argument is NULL
OS_ERR_NOT_IMPLEMENTED	if the system does not implement the requested socket/address domain

Reads data from a message-oriented (datagram) socket.

If a message is already available on the socket, this should immediately return that data without blocking. Otherwise, it may block up to the given timeout.

## **Parameters**

in	sock_id	The socket ID, previously bound using OS_SocketBind()
out	buffer	Pointer to message data receive buffer (must not be null)
in	buflen	The maximum length of the message data to receive (must not be zero)
out	RemoteAddr	Buffer to store the remote network address (may be NULL)
in	timeout	The maximum amount of time to wait, or OS_PEND to wait forever

#### Returns

Count of actual bytes received or error status, see OSAL Return Code Defines

OS_INVALID_POINTER	if argument is NULL
--------------------	---------------------

#### Return values

OS_ERR_INVALID_SIZE	if passed-in buflen is not valid
OS_ERR_INVALID_ID	if the sock_id parameter is not valid
OS_ERR_INCORRECT_OBJ_TYPE	if the handle is not a socket

Sends data to a message-oriented (datagram) socket.

This sends data in a non-blocking mode. If the socket is not currently able to queue the message, such as if its outbound buffer is full, then this returns an error code.

#### **Parameters**

in	sock_id	The socket ID, which must be of the datagram type
in	buffer	Pointer to message data to send (must not be null)
in	buflen	The length of the message data to send (must not be zero)
in	RemoteAddr	Buffer containing the remote network address to send to

#### Returns

Count of actual bytes sent or error status, see OSAL Return Code Defines

## **Return values**

OS_INVALID_POINTER	if argument is NULL
OS_ERR_INVALID_SIZE	if passed-in buflen is not valid
OS_ERR_INVALID_ID	if the sock_id parameter is not valid
OS_ERR_INCORRECT_OBJ_TYPE	if the handle is not a socket

Implement graceful shutdown of a stream socket.

This can be utilized to indicate the end of data stream without immediately closing the socket, giving the remote side an indication that the data transfer is complete.

# **Parameters**

in	sock⊷	The socket ID
	_id	
in	Mode	Whether to shutdown reading, writing, or both.

# Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	if the sock_id parameter is not valid
OS_ERR_INVALID_ARGUMENT	if the Mode argument is not one of the valid options
OS_ERR_INCORRECT_OBJ_TYPE	if the handle is not a socket
OS_ERR_INCORRECT_OBJ_STATE	if the socket is not connected

## 5.27 OSAL Task APIs

#### **Functions**

int32 OS\_TaskCreate (osal\_id\_t \*task\_id, const char \*task\_name, osal\_task\_entry function\_pointer, osal\_stackptr t\_stack\_pointer, size t\_stack\_size, osal\_priority\_t\_priority\_uint32 flags)

Creates a task and starts running it.

int32 OS\_TaskDelete (osal\_id\_t task\_id)

Deletes the specified Task.

void OS TaskExit (void)

Exits the calling task.

int32 OS\_TaskInstallDeleteHandler (osal\_task\_entry function\_pointer)

Installs a handler for when the task is deleted.

int32 OS TaskDelay (uint32 millisecond)

Delay a task for specified amount of milliseconds.

• int32 OS TaskSetPriority (osal id t task id, osal priority t new priority)

Sets the given task to a new priority.

osal\_id\_t OS\_TaskGetId (void)

Obtain the task id of the calling task.

• int32 OS\_TaskGetIdByName (osal\_id\_t \*task\_id, const char \*task\_name)

Find an existing task ID by name.

int32 OS\_TaskGetInfo (osal\_id\_t task\_id, OS\_task\_prop\_t \*task\_prop)

Fill a property object buffer with details regarding the resource.

• int32 OS\_TaskFindIdBySystemData (osal\_id\_t \*task\_id, const void \*sysdata, size\_t sysdata\_size)

Reverse-lookup the OSAL task ID from an operating system ID.

## 5.27.1 Detailed Description

#### 5.27.2 Function Documentation

Creates a task and starts running it.

Creates a task and passes back the id of the task created. Task names must be unique; if the name already exists this function fails. Names cannot be NULL.

Portable applications should always specify the actual stack size in the stack\_size parameter, not 0. This size value is not enforced/checked by OSAL, but is simply passed through to the RTOS for stack creation. Some RTOS implementations may assume 0 means a default stack size while others may actually create a task with no stack.

Unlike stack\_size, the stack\_pointer is optional and can be specified as NULL. In that case, a stack of the requested size will be dynamically allocated from the system heap.

5.27 OSAL Task APIs 135

## **Parameters**

out	task_id	will be set to the non-zero ID of the newly-created resource (must not be null)
in	task_name	the name of the new resource to create (must not be null)
in	function_pointer	the entry point of the new task (must not be null)
in	stack_pointer	pointer to the stack for the task, or NULL to allocate a stack from the system memory heap
in	stack_size	the size of the stack (must not be zero)
in	priority	initial priority of the new task
in	flags	initial options for the new task

## Returns

Execution status, see OSAL Return Code Defines

## **Return values**

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if any of the necessary pointers are NULL
OS_ERR_INVALID_SIZE	if the stack_size argument is zero
OS_ERR_NAME_TOO_LONG	name length including null terminator greater than OS_MAX_API_NAME
OS_ERR_INVALID_PRIORITY	if the priority is bad (return value only verified in coverage test)
OS_ERR_NO_FREE_IDS	if there can be no more tasks created
OS_ERR_NAME_TAKEN	if the name specified is already used by a task
OS_ERROR	if an unspecified/other error occurs (return value only verified in coverage test)

```
5.27.2.2 OS_TaskDelay() int32 OS_TaskDelay ( uint32 millisecond )
```

Delay a task for specified amount of milliseconds.

Causes the current thread to be suspended from execution for the period of millisecond. This is a scheduled wait (clock\_nanosleep/rtems\_task\_wake\_after/taskDelay), not a "busy" wait.

## **Parameters**

in millisecond Amount of time to delay
--

## Returns

Execution status, see OSAL Return Code Defines

## Return values

OS_SUCCESS	Successful execution.	]
OS_ERROR	if an unspecified/other error occurs (return value only verified in coverage test)	1

# **5.27.2.3 OS\_TaskDelete()** int32 OS\_TaskDelete ( osal\_id\_t task\_id )

Deletes the specified Task.

The task will be removed from the local tables. and the OS will be configured to stop executing the task at the next opportunity.

#### **Parameters**

in	task⊷	The object ID to operate on
	_id	

## Returns

Execution status, see OSAL Return Code Defines

## Return values

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	if the ID given to it is invalid
OS_ERROR	if the OS delete call fails (return value only verified in coverage test)

Exits the calling task.

The calling thread is terminated. This function does not return.

```
5.27.2.5 OS_TaskFindIdBySystemData() int32 OS_TaskFindIdBySystemData ( osal_id_t * task_id, const void * sysdata, size_t sysdata_size )
```

Reverse-lookup the OSAL task ID from an operating system ID.

5.27 OSAL Task APIs 137

This provides a method by which an external entity may find the OSAL task ID corresponding to a system-defined identifier (e.g. TASK\_ID, pthread\_t, rtems\_id, etc).

Normally OSAL does not expose the underlying OS-specific values to the application, but in some circumstances, such as exception handling, the OS may provide this information directly to a BSP handler outside of the normal OSAL API.

#### **Parameters**

out	task_id	The buffer where the task id output is stored (must not be null)
in	sysdata	Pointer to the system-provided identification data
in	sysdata_size	Size of the system-provided identification data

#### **Returns**

Execution status, see OSAL Return Code Defines

#### **Return values**

OS_SUCCESS	Successful execution. (return value only verified in coverage test)
OS_INVALID_POINTER	if a pointer argument is NULL

```
5.27.2.6 OS_TaskGetId() osal_id_t OS_TaskGetId ( void )
```

Obtain the task id of the calling task.

This function returns the task id of the calling task

#### Returns

Task ID, or zero if the operation failed (zero is never a valid task ID)

Find an existing task ID by name.

This function tries to find a task Id given the name of a task

## **Parameters**

out	task_id	will be set to the ID of the existing resource
—in	task_name	the name of the existing resource to find (must not be null)

Generated by Doxygen

#### Returns

Execution status, see OSAL Return Code Defines

#### Return values

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if the pointers passed in are NULL
OS_ERR_NAME_TOO_LONG	name length including null terminator greater than OS_MAX_API_NAME
OS_ERR_NAME_NOT_FOUND	if the name wasn't found in the table

Fill a property object buffer with details regarding the resource.

This function will pass back a pointer to structure that contains all of the relevant info (creator, stack size, priority, name) about the specified task.

#### **Parameters**

in	task_id	The object ID to operate on
out	task_prop	The property object buffer to fill (must not be null)

### Returns

Execution status, see OSAL Return Code Defines

#### Return values

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	if the ID passed to it is invalid
OS_INVALID_POINTER	if the task_prop pointer is NULL

```
5.27.2.9 OS_TaskInstallDeleteHandler() int32 OS_TaskInstallDeleteHandler ( osal_task_entry function_pointer )
```

Installs a handler for when the task is deleted.

This function is used to install a callback that is called when the task is deleted. The callback is called when OS\_Task Delete is called with the task ID. A task delete handler is useful for cleaning up resources that a task creates, before the task is removed from the system.

5.27 OSAL Task APIs 139

### **Parameters**

in function_pointer	function to be called when task exits	]
---------------------	---------------------------------------	---

### Returns

Execution status, see OSAL Return Code Defines

### Return values

OS_ERR_INVALID_ID	if the calling context is not an OSAL task
-------------------	--

Sets the given task to a new priority.

### **Parameters**

in	task_id	The object ID to operate on
in	new_priority	Set the new priority

# Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	if the ID passed to it is invalid
OS_ERR_INVALID_PRIORITY	if the priority is greater than the max allowed (return value only verified in coverage test)
OS_ERROR	if an unspecified/other error occurs (return value only verified in coverage test)

#### 5.28 OSAL Time Base APIs

#### **Functions**

Create an abstract Time Base resource.

int32 OS TimeBaseSet (osal id t timebase id, uint32 start time, uint32 interval time)

Sets the tick period for simulated time base objects.

int32 OS\_TimeBaseDelete (osal\_id\_t timebase\_id)

Deletes a time base object.

• int32 OS\_TimeBaseGetIdByName (osal\_id\_t \*timebase\_id, const char \*timebase\_name)

Find the ID of an existing time base resource.

int32 OS\_TimeBaseGetInfo (osal\_id\_t timebase\_id, OS\_timebase\_prop\_t \*timebase\_prop)

Obtain information about a timebase resource.

int32 OS TimeBaseGetFreeRun (osal id t timebase id, uint32 \*freerun val)

Read the value of the timebase free run counter.

### 5.28.1 Detailed Description

#### 5.28.2 Function Documentation

Create an abstract Time Base resource.

An OSAL time base is an abstraction of a "timer tick" that can, in turn, be used for measurement of elapsed time between events.

Time bases can be simulated by the operating system using the OS kernel-provided timing facilities, or based on a hardware timing source if provided by the BSP.

A time base object has a servicing task associated with it, that runs at elevated priority and will thereby interrupt user-level tasks when timing ticks occur.

If the external\_sync function is passed as NULL, the operating system kernel timing resources will be utilized for a simulated timer tick.

If the external\_sync function is not NULL, this should point to a BSP-provided function that will block the calling task until the next tick occurs. This can be used for synchronizing with hardware events.

Note

When provisioning a tunable RTOS kernel, such as RTEMS, the kernel should be configured to support at least (OS\_MAX\_TASKS + OS\_MAX\_TIMEBASES) threads, to account for the helper threads associated with time base objects.

This configuration API must not be used from the context of a timer callback. Timers should only be configured from the context of normal OSAL tasks.

### **Parameters**

out	timebase_id	will be set to the non-zero ID of the newly-created resource (must not be null)
in	timebase_name	The name of the time base (must not be null)
in	external_sync	A synchronization function for BSP hardware-based timer ticks

### Returns

Execution status, see OSAL Return Code Defines

#### **Return values**

OS_SUCCESS	Successful execution.
OS_ERR_NAME_TAKEN	if the name specified is already used
OS_ERR_NO_FREE_IDS	if there can be no more timebase resources created
OS_ERR_INCORRECT_OBJ_STATE	if called from timer/timebase context
OS_ERR_NAME_TOO_LONG	if the timebase_name is too long
OS_INVALID_POINTER	if a pointer argument is NULL

# **5.28.2.2 OS\_TimeBaseDelete()** int32 OS\_TimeBaseDelete ( osal\_id\_t timebase\_id )

Deletes a time base object.

The helper task and any other resources associated with the time base abstraction will be freed.

### Note

This configuration API must not be used from the context of a timer callback. Timers should only be configured from the context of normal OSAL tasks.

# **Parameters**

in	timebase⊷	The timebase resource to delete
	_id	

#### Returns

Execution status, see OSAL Return Code Defines

# **Return values**

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	if the id passed in is not a valid timebase
OS_ERR_INCORRECT_OBJ_STATE	if called from timer/timebase context

Generated by Doxygen

```
5.28.2.3 OS_TimeBaseGetFreeRun() int32 OS_TimeBaseGetFreeRun ( osal_id_t timebase_id, uint32 * freerun_val )
```

Read the value of the timebase free run counter.

Poll the timer free-running time counter in a lightweight fashion.

The free run count is a monotonically increasing value reflecting the total time elapsed since the timebase inception. Units are the same as the timebase itself, usually microseconds.

Applications may quickly and efficiently calculate relative time differences by polling this value and subtracting the previous counter value.

The absolute value of this counter is not relevant, because it will "roll over" after  $2^32$  units of time. For a timebase with microsecond units, this occurs approximately every 4294 seconds, or about 1.2 hours.

#### Note

To ensure consistency of results, the application should sample the value at a minimum of two times the roll over frequency, and calculate the difference between the consecutive samples.

### **Parameters**

in	timebase↔ _id	The timebase to operate on
out	freerun_val	Buffer to store the free run counter (must not be null)

### Returns

Execution status, see OSAL Return Code Defines

### Return values

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	if the id passed in is not a valid timebase
OS_INVALID_POINTER	if pointer argument is NULL

```
5.28.2.4 OS_TimeBaseGetIdByName() int32 OS_TimeBaseGetIdByName ( osal_id_t * timebase_id, const char * timebase_name )
```

Find the ID of an existing time base resource.

Given a time base name, find and output the ID associated with it.

#### Note

This configuration API must not be used from the context of a timer callback. Timers should only be configured from the context of normal OSAL tasks.

#### **Parameters**

(	out	timebase_id	will be set to the non-zero ID of the matching resource (must not be null)
-	in	timebase_name	The name of the timebase resource to find (must not be null)

#### Returns

Execution status, see OSAL Return Code Defines

#### **Return values**

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if timebase_id or timebase_name are NULL pointers
OS_ERR_NAME_TOO_LONG	name length including null terminator greater than OS_MAX_API_NAME
OS_ERR_NAME_NOT_FOUND	if the name was not found in the table
OS_ERR_INCORRECT_OBJ_STATE	if called from timer/timebase context

Obtain information about a timebase resource.

Fills the buffer referred to by the timebase\_prop parameter with relevant information about the time base resource.

This function will pass back a pointer to structure that contains all of the relevant info( name and creator) about the specified timebase.

#### Note

This configuration API must not be used from the context of a timer callback. Timers should only be configured from the context of normal OSAL tasks.

### **Parameters**

in	timebase_id	The timebase resource ID
out	timebase_prop	Buffer to store timebase properties (must not be null)

#### Returns

Execution status, see OSAL Return Code Defines

#### **Return values**

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	if the id passed in is not a valid timebase
OS_INVALID_POINTER	if the timebase_prop pointer is null
OS_ERR_INCORRECT_OBJ_STATE	if called from timer/timebase context

Sets the tick period for simulated time base objects.

This sets the actual tick period for timing ticks that are simulated by the RTOS kernel (i.e. the "external\_sync" parameter on the call to OS\_TimeBaseCreate() is NULL).

The RTOS will be configured to wake up the helper thread at the requested interval.

This function has no effect for time bases that are using a BSP-provided external\_sync function.

### Note

This configuration API must not be used from the context of a timer callback. Timers should only be configured from the context of normal OSAL tasks.

# Parameters

in	timebase_id	The timebase resource to configure
in	start_time	The amount of delay for the first tick, in microseconds.
in	interval_time	The amount of delay between ticks, in microseconds.

### Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	if the id passed in is not a valid timebase
OS_ERR_INCORRECT_OBJ_STATE	if called from timer/timebase context
OS_TIMER_ERR_INVALID_ARGS	if start_time or interval_time are out of range

5.29 OSAL Timer APIs 145

#### 5.29 OSAL Timer APIs

#### **Functions**

int32 OS\_TimerCreate (osal\_id\_t \*timer\_id, const char \*timer\_name, uint32 \*clock\_accuracy, OS\_TimerCallback\_t
 callback\_ptr)

Create a timer object.

int32 OS\_TimerAdd (osal\_id\_t \*timer\_id, const char \*timer\_name, osal\_id\_t timebase\_id, OS\_ArgCallback\_t callback ptr, void \*callback arg)

Add a timer object based on an existing TimeBase resource.

• int32 OS\_TimerSet (osal\_id\_t timer\_id, uint32 start\_time, uint32 interval\_time)

Configures a periodic or one shot timer.

int32 OS\_TimerDelete (osal\_id\_t timer\_id)

Deletes a timer resource.

• int32 OS\_TimerGetIdByName (osal\_id\_t \*timer\_id, const char \*timer\_name)

Locate an existing timer resource by name.

int32 OS\_TimerGetInfo (osal\_id\_t timer\_id, OS\_timer\_prop\_t \*timer\_prop)

Gets information about an existing timer.

#### 5.29.1 Detailed Description

#### 5.29.2 Function Documentation

Add a timer object based on an existing TimeBase resource.

A timer object is a resource that invokes the specified application-provided function upon timer expiration. Timers may be one-shot or periodic in nature.

This function uses an existing time base object to service this timer, which must exist prior to adding the timer. The precision of the timer is the same as that of the underlying time base object. Multiple timer objects can be created referring to a single time base object.

This routine also uses a different callback function prototype from OS\_TimerCreate(), allowing a single opaque argument to be passed to the callback routine. The OSAL implementation does not use this parameter, and may be set NULL.

The callback function for this method should be declared according to the OS\_ArgCallback\_t function pointer type. The timer\_id is passed in to the function by the OSAL, and the arg parameter is passed through from the callback\_arg argument on this call.

Note

This configuration API must not be used from the context of a timer callback. Timers should only be configured from the context of normal OSAL tasks.

See also

OS\_ArgCallback\_t

#### **Parameters**

out	timer_id	Will be set to the non-zero resource ID of the timer object (must not be null)
in	timer_name Name of the timer object (must not be null)	
in	timebase↔	The time base resource to use as a reference
	_id	
in	callback_ptr	Application-provided function to invoke (must not be null)

### Returns

Execution status, see OSAL Return Code Defines

### **Return values**

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if any parameters are NULL
OS_ERR_INVALID_ID	if the timebase_id parameter is not valid
OS_ERR_NAME_TOO_LONG	name length including null terminator greater than OS_MAX_API_NAME
OS_ERR_NAME_TAKEN	if the name is already in use by another timer.
OS_ERR_NO_FREE_IDS	if all of the timers are already allocated.
OS_ERR_INCORRECT_OBJ_STATE	if invoked from a timer context
OS_TIMER_ERR_INTERNAL	if there was an error programming the OS timer (return value only verified
	in coverage test)

# Create a timer object.

A timer object is a resource that invokes the specified application-provided function upon timer expiration. Timers may be one-shot or periodic in nature.

This function creates a dedicated (hidden) time base object to service this timer, which is created and deleted with the timer object itself. The internal time base is configured for an OS simulated timer tick at the same interval as the timer.

The callback function should be declared according to the OS\_TimerCallback\_t function pointer type. The timer\_id value is passed to the callback function.

5.29 OSAL Timer APIs 147

#### Note

clock\_accuracy comes from the underlying OS tick value. The nearest integer microsecond value is returned, so may not be exact.

This configuration API must not be used from the context of a timer callback. Timers should only be configured from the context of normal OSAL tasks.

#### See also

OS\_TimerCallback\_t

#### **Parameters**

out	timer_id	Will be set to the non-zero resource ID of the timer object (must not be null)	
in	timer_name	Name of the timer object (must not be null)	
out	clock_accuracy	Expected precision of the timer, in microseconds. This is the underlying tick value rounded to the nearest microsecond integer. (must not be null)	
in	callback_ptr	The function pointer of the timer callback (must not be null).	

### Returns

Execution status, see OSAL Return Code Defines

### **Return values**

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if any parameters are NULL
OS_ERR_NAME_TOO_LONG	name length including null terminator greater than OS_MAX_API_NAME
OS_ERR_NAME_TAKEN	if the name is already in use by another timer.
OS_ERR_NO_FREE_IDS	if all of the timers are already allocated.
OS_ERR_INCORRECT_OBJ_STATE	if invoked from a timer context
OS_TIMER_ERR_INTERNAL	if there was an error programming the OS timer (return value only verified
	in coverage test)

Deletes a timer resource.

The application callback associated with the timer will be stopped, and the resources freed for future use.

### Note

This configuration API must not be used from the context of a timer callback. Timers should only be configured from the context of normal OSAL tasks.

### **Parameters**

in	timer←	The timer ID to operate on
	_id	

# Returns

Execution status, see OSAL Return Code Defines

### **Return values**

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	if the timer_id is invalid.
OS_TIMER_ERR_INTERNAL	if there was a problem deleting the timer in the host OS (return value only verified in coverage test)
OS_ERR_INCORRECT_OBJ_STATE	if called from timer/timebase context

Locate an existing timer resource by name.

Outputs the ID associated with the given timer, if it exists.

### Note

This configuration API must not be used from the context of a timer callback. Timers should only be configured from the context of normal OSAL tasks.

#### **Parameters**

out	timer_id	Will be set to the timer ID corresponding to the name (must not be null)
in	timer_name	The timer name to find (must not be null)

# Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.
OS_INVALID_POINTER	if timer_id or timer_name are NULL pointers
OS_ERR_NAME_TOO_LONG	name length including null terminator greater than OS_MAX_API_NAME

5.29 OSAL Timer APIs 149

### **Return values**

OS_ERR_NAME_NOT_FOUND	if the name was not found in the table
OS_ERR_INCORRECT_OBJ_STATE	if called from timer/timebase context

Gets information about an existing timer.

This function takes timer\_id, and looks it up in the OS table. It puts all of the information known about that timer into a structure pointer to by timer\_prop.

# Note

This configuration API must not be used from the context of a timer callback. Timers should only be configured from the context of normal OSAL tasks.

### **Parameters**

in	timer_id	The timer ID to operate on
out	timer_prop	Buffer containing timer properties (must not be null)
		creator: the OS task ID of the task that created this timer
		name: the string name of the timer
		<ul> <li>start_time: the start time in microseconds, if any</li> </ul>
		<ul> <li>interval_time: the interval time in microseconds, if any</li> </ul>
		accuracy: the accuracy of the timer in microseconds

### Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	if the id passed in is not a valid timer
OS_INVALID_POINTER	if the timer_prop pointer is null
OS_ERR_INCORRECT_OBJ_STATE	if called from timer/timebase context

Configures a periodic or one shot timer.

This function programs the timer with a start time and an optional interval time. The start time is the time in microseconds when the user callback function will be called. If the interval time is non-zero, the timer will be reprogrammed with that interval in microseconds to call the user callback function periodically. If the start time and interval time are zero, the function will return an error.

For a "one-shot" timer, the start\_time configures the expiration time, and the interval\_time should be passed as zero to indicate the timer is not to be automatically reset.

#### Note

The resolution of the times specified is limited to the clock accuracy returned in the OS\_TimerCreate call. If the times specified in the start\_msec or interval\_msec parameters are less than the accuracy, they will be rounded up to the accuracy of the timer.

This configuration API must not be used from the context of a timer callback. Timers should only be configured from the context of normal OSAL tasks.

#### **Parameters**

in	timer_id	The timer ID to operate on
in	start_time	Time in microseconds to the first expiration
in	interval_time	Time in microseconds between subsequent intervals, value of zero will only call the user callback function once after the start_msec time.

#### Returns

Execution status, see OSAL Return Code Defines

OS_SUCCESS	Successful execution.
OS_ERR_INVALID_ID	if the timer_id is not valid.
OS_TIMER_ERR_INTERNAL	if there was an error programming the OS timer (return value only verified in coverage test)
OS_ERR_INCORRECT_OBJ_STATE	if called from timer/timebase context
OS_TIMER_ERR_INVALID_ARGS	if the start_time or interval_time is out of range, or both 0

# 6 Data Structure Documentation

# 6.1 OS\_bin\_sem\_prop\_t Struct Reference

OSAL binary semaphore properties.

```
#include <osapi-binsem.h>
```

### **Data Fields**

- char name [OS\_MAX\_API\_NAME]
- · osal\_id\_t creator
- int32 value

### 6.1.1 Detailed Description

OSAL binary semaphore properties.

Definition at line 39 of file osapi-binsem.h.

# 6.4 os\_dirent\_t Struct Reference

Directory entry.

#include <osapi-dir.h>

# **Data Fields**

char FileName [OS\_MAX\_FILE\_NAME]

### 6.4.1 Detailed Description

Directory entry.

Definition at line 32 of file osapi-dir.h.

#### 6.4.2 Field Documentation

#### **6.4.2.1 FileName** char os\_dirent\_t::FileName[OS\_MAX\_FILE\_NAME]

Definition at line 34 of file osapi-dir.h.

The documentation for this struct was generated from the following file:

· osal/src/os/inc/osapi-dir.h

# 6.5 OS\_FdSet Struct Reference

An abstract structure capable of holding several OSAL IDs.

```
#include <osapi-select.h>
```

#### **Data Fields**

uint8 object\_ids [(OS\_MAX\_NUM\_OPEN\_FILES+7)/8]

### 6.5.1 Detailed Description

An abstract structure capable of holding several OSAL IDs.

This is part of the select API and is manipulated using the related API calls. It should not be modified directly by applications.

Note: Math is to determine uint8 array size needed to represent single bit OS\_MAX\_NUM\_OPEN\_FILES objects, + 7 rounds up and 8 is the size of uint8.

See also

OS\_SelectFdZero(), OS\_SelectFdAdd(), OS\_SelectFdClear(), OS\_SelectFdIsSet()

Definition at line 43 of file osapi-select.h.

# 6.5.2 Field Documentation

```
6.5.2.1 object_ids uint8 OS_FdSet::object_ids[(OS_MAX_NUM_OPEN_FILES+7)/8]
```

Definition at line 45 of file osapi-select.h.

The documentation for this struct was generated from the following file:

• osal/src/os/inc/osapi-select.h

# 6.6 OS\_file\_prop\_t Struct Reference

OSAL file properties.

```
#include <osapi-file.h>
```

### **Data Fields**

- char Path [OS\_MAX\_PATH\_LEN]
- osal\_id\_t User
- uint8 IsValid

### 6.6.1 Detailed Description

OSAL file properties.

Definition at line 49 of file osapi-file.h.

### 6.6.2 Field Documentation

# **6.6.2.1 IsValid** uint8 OS\_file\_prop\_t::IsValid

Definition at line 53 of file osapi-file.h.

```
6.6.2.2 Path char OS_file_prop_t::Path[OS_MAX_PATH_LEN]
```

Definition at line 51 of file osapi-file.h.

```
6.6.2.3 User osal_id_t OS_file_prop_t::User
```

Definition at line 52 of file osapi-file.h.

The documentation for this struct was generated from the following file:

• osal/src/os/inc/osapi-file.h

# 6.7 os\_fsinfo\_t Struct Reference

OSAL file system info.

```
#include <osapi-filesys.h>
```

#### **Data Fields**

uint32 MaxFds

Total number of file descriptors.

• uint32 FreeFds

Total number that are free.

uint32 MaxVolumes

Maximum number of volumes.

· uint32 FreeVolumes

Total number of volumes free.

# 6.7.1 Detailed Description

OSAL file system info.

Definition at line 35 of file osapi-filesys.h.

#### 6.7.2 Field Documentation

### **6.7.2.1 FreeFds** uint32 os\_fsinfo\_t::FreeFds

Total number that are free.

Definition at line 38 of file osapi-filesys.h.

# **6.7.2.2 FreeVolumes** uint32 os\_fsinfo\_t::FreeVolumes

Total number of volumes free.

Definition at line 40 of file osapi-filesys.h.

Total number of file descriptors.

Definition at line 37 of file osapi-filesys.h.

### **6.7.2.4 MaxVolumes** uint32 os\_fsinfo\_t::MaxVolumes

Maximum number of volumes.

Definition at line 39 of file osapi-filesys.h.

The documentation for this struct was generated from the following file:

• osal/src/os/inc/osapi-filesys.h

# 6.8 os\_fstat\_t Struct Reference

File system status.

#include <osapi-file.h>

- uint32 FileModeBits
- OS\_time\_t FileTime
- size\_t FileSize

# 6.8.1 Detailed Description

File system status.

Note

This used to be directly typedef'ed to the "struct stat" from the C library

Some C libraries (glibc in particular) actually define member names to reference into sub-structures, so attempting to reuse a name like "st\_mtime" might not work.

Definition at line 64 of file osapi-file.h.

- char name [OS\_MAX\_API\_NAME]
- · osal id t creator

#### 6.12.1 Detailed Description

OSAL mutex properties.

Definition at line 32 of file osapi-mutex.h.

# 6.12.2 Field Documentation

```
6.12.2.1 creator osal_id_t OS_mut_sem_prop_t::creator
```

Definition at line 35 of file osapi-mutex.h.

```
6.12.2.2 name char OS_mut_sem_prop_t::name[OS_MAX_API_NAME]
```

Definition at line 34 of file osapi-mutex.h.

The documentation for this struct was generated from the following file:

• osal/src/os/inc/osapi-mutex.h

# 6.13 OS\_queue\_prop\_t Struct Reference

OSAL queue properties.

```
#include <osapi-queue.h>
```

- char name [OS\_MAX\_API\_NAME]
- osal\_id\_t creator

# 6.13.1 Detailed Description

OSAL queue properties.

Definition at line 32 of file osapi-queue.h.

#### 6.13.2 Field Documentation

```
6.13.2.1 creator osal_id_t OS_queue_prop_t::creator
```

Definition at line 35 of file osapi-queue.h.

```
6.13.2.2 name char OS_queue_prop_t::name[OS_MAX_API_NAME]
```

Definition at line 34 of file osapi-queue.h.

The documentation for this struct was generated from the following file:

• osal/src/os/inc/osapi-queue.h

# 6.14 OS\_SockAddr\_t Struct Reference

Encapsulates a generic network address.

```
#include <osapi-sockets.h>
```

#### **Data Fields**

size\_t ActualLength

Length of the actual address data.

• OS\_SockAddrData\_t AddrData

Abstract Address data.

# 6.14.1 Detailed Description

Encapsulates a generic network address.

This is just an abstract buffer type that holds a network address. It is allocated for the worst-case size defined by OS\_SOCKADDR\_MAX\_LEN, and the real size is stored within.

Definition at line 109 of file osapi-sockets.h.

### 6.14.2 Field Documentation

### 6.14.2.1 ActualLength size\_t OS\_SockAddr\_t::ActualLength

Length of the actual address data.

Definition at line 111 of file osapi-sockets.h.

### **6.14.2.2** AddrData OS\_SockAddrData\_t OS\_SockAddr\_t::AddrData

Abstract Address data.

Definition at line 112 of file osapi-sockets.h.

The documentation for this struct was generated from the following file:

osal/src/os/inc/osapi-sockets.h

# 6.15 OS\_SockAddrData\_t Union Reference

Storage buffer for generic network address.

```
#include <osapi-sockets.h>
```

# **Data Fields**

uint8 Buffer [OS\_SOCKADDR\_MAX\_LEN]

Ensures length of at least OS\_SOCKADDR\_MAX\_LEN.

uint32 AlignU32

Ensures uint32 alignment.

void \* AlignPtr

Ensures pointer alignment.

### 6.15.1 Detailed Description

Storage buffer for generic network address.

This is a union type that helps to ensure a minimum alignment value for the data storage, such that it can be cast to the system-specific type without increasing alignment requirements.

Definition at line 95 of file osapi-sockets.h.

# 6.15.2 Field Documentation

**6.15.2.1 AlignPtr** void\* OS\_SockAddrData\_t::AlignPtr

Ensures pointer alignment.

Definition at line 99 of file osapi-sockets.h.

**6.15.2.2 AlignU32** uint32 OS\_SockAddrData\_t::AlignU32

Ensures uint32 alignment.

Definition at line 98 of file osapi-sockets.h.

**6.15.2.3 Buffer** uint8 OS\_SockAddrData\_t::Buffer[OS\_SOCKADDR\_MAX\_LEN]

Ensures length of at least OS\_SOCKADDR\_MAX\_LEN.

Definition at line 97 of file osapi-sockets.h.

The documentation for this union was generated from the following file:

• osal/src/os/inc/osapi-sockets.h

# 6.16 OS\_socket\_prop\_t Struct Reference

Encapsulates socket properties.

#include <osapi-sockets.h>

# **Data Fields**

• char name [OS\_MAX\_API\_NAME]

Name of the socket.

· osal\_id\_t creator

OSAL TaskID which opened the socket.

# 6.16.1 Detailed Description

Encapsulates socket properties.

This is for consistency with other OSAL resource types. Currently no extra properties are exposed here but this could change in a future revision of OSAL as needed.

Definition at line 122 of file osapi-sockets.h.

### 6.16.2 Field Documentation

```
6.16.2.1 creator osal_id_t OS_socket_prop_t::creator
```

OSAL TaskID which opened the socket.

Definition at line 125 of file osapi-sockets.h.

```
6.16.2.2 name char OS_socket_prop_t::name[OS_MAX_API_NAME]
```

Name of the socket.

Definition at line 124 of file osapi-sockets.h.

The documentation for this struct was generated from the following file:

• osal/src/os/inc/osapi-sockets.h

# 6.17 OS\_static\_symbol\_record\_t Struct Reference

Associates a single symbol name with a memory address.

```
#include <osapi-module.h>
```

- const char \* Name
- void(\* Address )(void)
- const char \* Module

# 6.17.1 Detailed Description

Associates a single symbol name with a memory address.

If the OS\_STATIC\_SYMBOL\_TABLE feature is enabled, then an array of these structures should be provided by the application. When the application needs to find a symbol address, the static table will be checked in addition to (or instead of) the OS/library-provided lookup function.

This static symbol allows systems that do not implement dynamic module loading to maintain the same semantics as dynamically loaded modules.

Definition at line 113 of file osapi-module.h.

#### 6.17.2 Field Documentation

```
6.17.2.1 Address void(* OS_static_symbol_record_t::Address) (void)

# 6.20 OS\_time\_t Struct Reference

OSAL time interval structure.

#include <osapi-clock.h>

#### **Data Fields**

· int64 ticks

### 6.20.1 Detailed Description

OSAL time interval structure.

This is used to represent a basic time interval.

When used with OS\_GetLocalTime/OS\_SetLocalTime, this represents the interval from the OS's epoch point, typically 01 Jan 1970 00:00:00 UTC on systems that have a persistent real time clock (RTC), or the system boot time if there is no RTC available.

Applications should not directly access fields within this structure, as the definition may change in future versions of OSAL. Instead, applications should use the accessor/conversion methods defined below.

Definition at line 45 of file osapi-clock.h.

#### 6.20.2 Field Documentation

### **6.20.2.1 ticks** int64 OS\_time\_t::ticks

Ticks elapsed since reference point

Definition at line 47 of file osapi-clock.h.

Referenced by OS\_TimeAdd(), OS\_TimeAssembleFromMicroseconds(), OS\_TimeAssembleFromMilliseconds(), O $\leftarrow$  S\_TimeAssembleFromNanoseconds(), OS\_TimeAssembleFromSubseconds(), OS\_TimeGetFractionalPart(), OS\_ $\leftarrow$  TimeGetTotalMicroseconds(), OS\_TimeGetTotalMilliseconds(), OS\_TimeGetTotalNanoseconds(), OS\_TimeGetTotalConds(),

The maximum number of condition variables to support.

#define OS\_MAX\_MODULES 20

The maximum number of modules to support.

• #define OS\_MAX\_TIMEBASES 5

The maximum number of timebases to support.

#define OS MAX TIMERS 10

The maximum number of timer callbacks to support.

#define OS MAX NUM OPEN FILES 50

The maximum number of concurrently open files to support.

#define OS\_MAX\_NUM\_OPEN\_DIRS 4

The maximum number of concurrently open directories to support.

#define OS MAX FILE SYSTEMS 14

The maximum number of file systems to support.

#define OS MAX SYM LEN 64

The maximum length of symbols.

#define OS MAX FILE NAME 20

The maximum length of OSAL file names.

#define OS MAX PATH LEN 64

The maximum length of OSAL path names.

#define OS MAX API NAME 20

The maximum length of OSAL resource names.

#define OS SOCKADDR MAX LEN 28

The maximum size of the socket address structure.

#define OS BUFFER SIZE 172

The maximum size of output produced by a single OS\_printf()

#define OS\_BUFFER\_MSG\_DEPTH 100

The maximum number of OS printf() output strings to buffer.

• #define OS\_UTILITYTASK\_PRIORITY 245

Priority level of the background utility task.

#define OS\_UTILITYTASK\_STACK\_SIZE 2048

The stack size of the background utility task.

#define OS\_MAX\_CMD\_LEN 1000

The maximum size of a shell command.

#define OS\_QUEUE\_MAX\_DEPTH 50

The maximum depth of OSAL queues.

#define OS\_SHELL\_CMD\_INPUT\_FILE\_NAME ""

The name of the temporary file used to store shell commands.

#define OS\_PRINTF\_CONSOLE\_NAME ""

The name of the primary console device.

#define OS\_ADD\_TASK\_FLAGS 0

Flags added to all tasks on creation.

• #define OS\_MAX\_CONSOLES 1

The maximum number of console devices to support.

#define OS MODULE FILE EXTENSION ".so"

The system-specific file extension used on loadable module files.

- #define OS FS DEV NAME LEN 32
- #define OS\_FS\_PHYS\_NAME\_LEN 64
- #define OS FS VOL NAME LEN 32

# 7.1.1 Macro Definition Documentation

### 7.1.1.1 OS\_ADD\_TASK\_FLAGS #define OS\_ADD\_TASK\_FLAGS 0

Flags added to all tasks on creation.

Added to the task flags on creation

Supports adding floating point support for all tasks when the OS requires it

Definition at line 254 of file osconfig.h.

# 7.1.1.2 OS\_BUFFER\_MSG\_DEPTH #define OS\_BUFFER\_MSG\_DEPTH 100

The maximum number of OS\_printf() output strings to buffer.

Based on the OSAL\_CONFIG\_PRINTF\_BUFFER\_DEPTH configuration option

Definition at line 187 of file osconfig.h.

## 7.1.1.3 OS\_BUFFER\_SIZE #define OS\_BUFFER\_SIZE 172

The maximum size of output produced by a single OS\_printf()

Based on the OSAL\_CONFIG\_PRINTF\_BUFFER\_SIZE configuration option

Definition at line 180 of file osconfig.h.

## 7.1.1.4 OS\_FS\_DEV\_NAME\_LEN #define OS\_FS\_DEV\_NAME\_LEN 32

Device name length

Definition at line 281 of file osconfig.h.

# 7.1.1.5 OS\_FS\_PHYS\_NAME\_LEN #define OS\_FS\_PHYS\_NAME\_LEN 64

Physical drive name length

Definition at line 282 of file osconfig.h.

# 7.1.1.6 OS\_FS\_VOL\_NAME\_LEN #define OS\_FS\_VOL\_NAME\_LEN 32

Volume name length

Definition at line 283 of file osconfig.h.

# 7.1.1.7 OS\_MAX\_API\_NAME #define OS\_MAX\_API\_NAME 20

The maximum length of OSAL resource names.

Based on the OSAL\_CONFIG\_MAX\_API\_NAME configuration option

Note

This value must include a terminating NUL character

Definition at line 163 of file osconfig.h.

### 7.1.1.8 OS\_MAX\_BIN\_SEMAPHORES #define OS\_MAX\_BIN\_SEMAPHORES 20

The maximum number of binary semaphores to support.

Based on the OSAL CONFIG MAX BIN SEMAPHORES configuration option

Definition at line 65 of file osconfig.h.

# 7.1.1.9 OS\_MAX\_CMD\_LEN #define OS\_MAX\_CMD\_LEN 1000

The maximum size of a shell command.

This limit is only applicable if shell support is enabled.

Based on the OSAL\_CONFIG\_MAX\_CMD\_LEN configuration option

Note

This value must include a terminating NUL character

Definition at line 218 of file osconfig.h.

# 7.1.1.10 OS\_MAX\_CONDVARS #define OS\_MAX\_CONDVARS 4

The maximum number of condition variables to support.

Based on the OSAL\_CONFIG\_MAX\_CONDVARS configuration option

Definition at line 79 of file osconfig.h.

### 7.1.1.11 OS MAX CONSOLES #define OS\_MAX\_CONSOLES 1

The maximum number of console devices to support.

Fixed value based on current OSAL implementation, not user configurable.

Definition at line 269 of file osconfig.h.

### 7.1.1.12 OS MAX COUNT SEMAPHORES #define OS\_MAX\_COUNT\_SEMAPHORES 20

The maximum number of counting semaphores to support.

Based on the OSAL\_CONFIG\_MAX\_COUNT\_SEMAPHORES configuration option

Definition at line 58 of file osconfig.h.

# 7.1.1.13 OS\_MAX\_FILE\_NAME #define OS\_MAX\_FILE\_NAME 20

The maximum length of OSAL file names.

This limit applies specifically to the file name portion, not the directory portion, of a path name.

Based on the OSAL\_CONFIG\_MAX\_FILE\_NAME configuration option

Note

This value must include a terminating NUL character

Definition at line 142 of file osconfig.h.

# 7.1.1.14 OS\_MAX\_FILE\_SYSTEMS #define OS\_MAX\_FILE\_SYSTEMS 14

The maximum number of file systems to support.

Based on the OSAL\_CONFIG\_MAX\_FILE\_SYSTEMS configuration option

Definition at line 121 of file osconfig.h.

### 7.1.1.15 OS\_MAX\_MODULES #define OS\_MAX\_MODULES 20

The maximum number of modules to support.

Based on the OSAL\_CONFIG\_MAX\_MODULES configuration option

Definition at line 86 of file osconfig.h.

### 7.1.1.16 OS\_MAX\_MUTEXES #define OS\_MAX\_MUTEXES 20

The maximum number of mutexes to support.

Based on the OSAL\_CONFIG\_MAX\_MUTEXES configuration option

Definition at line 72 of file osconfig.h.

### 7.1.1.17 OS MAX NUM OPEN DIRS #define OS\_MAX\_NUM\_OPEN\_DIRS 4

The maximum number of concurrently open directories to support.

Based on the OSAL\_CONFIG\_MAX\_NUM\_OPEN\_DIRS configuration option

Definition at line 114 of file osconfig.h.

# 7.1.1.18 OS\_MAX\_NUM\_OPEN\_FILES #define OS\_MAX\_NUM\_OPEN\_FILES 50

The maximum number of concurrently open files to support.

Based on the OSAL\_CONFIG\_MAX\_NUM\_OPEN\_FILES configuration option

Definition at line 107 of file osconfig.h.

7.1.1.19 OS\_MAX\_PATH\_LEN #define OS\_MAX\_PATH\_LEN 64

The maximum length of OSAL path names.

This limit applies to the overall length of a path name, including the file name and directory portions.

Based on the OSAL CONFIG MAX PATH LEN configuration option

Note

This value must include a terminating NUL character

Definition at line 154 of file osconfig.h.

7.1.1.20 OS\_MAX\_QUEUES #define OS\_MAX\_QUEUES 64

The maximum number of queues to support.

Based on the OSAL CONFIG MAX QUEUES configuration option

Definition at line 51 of file osconfig.h.

7.1.1.21 OS\_MAX\_SYM\_LEN #define OS\_MAX\_SYM\_LEN 64

The maximum length of symbols.

Based on the OSAL CONFIG MAX SYM LEN configuration option

Note

This value must include a terminating NUL character

Definition at line 130 of file osconfig.h.

7.1.1.22 OS\_MAX\_TASKS #define OS\_MAX\_TASKS 64

The maximum number of to support.

Based on the OSAL\_CONFIG\_MAX\_TASKS configuration option

Definition at line 44 of file osconfig.h.

# 7.1.1.23 OS\_MAX\_TIMEBASES #define OS\_MAX\_TIMEBASES 5

The maximum number of timebases to support.

Based on the OSAL CONFIG MAX TIMEBASES configuration option

Definition at line 93 of file osconfig.h.

### 7.1.1.24 OS\_MAX\_TIMERS #define OS\_MAX\_TIMERS 10

The maximum number of timer callbacks to support.

Based on the OSAL\_CONFIG\_MAX\_TIMERS configuration option

Definition at line 100 of file osconfig.h.

## 7.1.1.25 OS\_MODULE\_FILE\_EXTENSION #define OS\_MODULE\_FILE\_EXTENSION ".so"

The system-specific file extension used on loadable module files.

Fixed value based on system selection, not user configurable.

Definition at line 276 of file osconfig.h.

### 7.1.1.26 OS PRINTF CONSOLE NAME #define OS\_PRINTF\_CONSOLE\_NAME ""

The name of the primary console device.

This is the device to which OS\_printf() output is written. The output may be configured to tag each line with this prefix for identification.

Based on the OSAL\_CONFIG\_PRINTF\_CONSOLE\_NAME configuration option

Definition at line 245 of file osconfig.h.

# 7.1.1.27 OS\_QUEUE\_MAX\_DEPTH #define OS\_QUEUE\_MAX\_DEPTH 50

The maximum depth of OSAL queues.

Based on the OSAL\_CONFIG\_QUEUE\_MAX\_DEPTH configuration option

Definition at line 225 of file osconfig.h.

# 7.1.1.28 OS\_SHELL\_CMD\_INPUT\_FILE\_NAME #define OS\_SHELL\_CMD\_INPUT\_FILE\_NAME ""

The name of the temporary file used to store shell commands.

This configuration is only applicable if shell support is enabled, and only necessary/relevant on some OS implementations.

Based on the OSAL CONFIG SHELL CMD INPUT FILE NAME configuration option

Definition at line 235 of file osconfig.h.

# 7.1.1.29 OS\_SOCKADDR\_MAX\_LEN #define OS\_SOCKADDR\_MAX\_LEN 28

The maximum size of the socket address structure.

This is part of the Socket API, and should be set large enough to hold the largest address type in use on the target system.

Based on the OSAL CONFIG SOCKADDR MAX LEN configuration option

Definition at line 173 of file osconfig.h.

# 7.1.1.30 OS\_UTILITYTASK\_PRIORITY #define OS\_UTILITYTASK\_PRIORITY 245

Priority level of the background utility task.

This task is responsible for writing buffered output of OS\_printf to the actual console device, and any other future maintenance task.

Based on the OSAL\_CONFIG\_UTILITYTASK\_PRIORITY configuration option

Definition at line 197 of file osconfig.h.

### 7.1.1.31 OS\_UTILITYTASK\_STACK\_SIZE #define OS\_UTILITYTASK\_STACK\_SIZE 2048

The stack size of the background utility task.

This task is responsible for writing buffered output of OS\_printf to the actual console device, and any other future maintenance task.

Based on the OSAL\_CONFIG\_UTILITYTASK\_STACK\_SIZE configuration option

Definition at line 207 of file osconfig.h.

7.1.1.32 OSAL\_CONFIG\_CONSOLE\_ASYNC #define OSAL\_CONFIG\_CONSOLE\_ASYNC

Definition at line 27 of file osconfig.h.

7.1.1.33 OSAL\_CONFIG\_INCLUDE\_DYNAMIC\_LOADER #define OSAL\_CONFIG\_INCLUDE\_DYNAMIC\_LOADER

Configuration file Operating System Abstraction Layer.

The specific definitions in this file may only be modified by setting the respective OSAL configuration options in the CMake build.

Any direct modifications to the generated copy will be overwritten each time CMake executes.

Note

This file was automatically generated by CMake from /home/runner/work/cFS/cFS/osal/default\_config.cmake

Definition at line 21 of file osconfig.h.

7.1.1.34 OSAL\_CONFIG\_INCLUDE\_NETWORK #define OSAL\_CONFIG\_INCLUDE\_NETWORK

Definition at line 22 of file osconfig.h.

7.1.1.35 OSAL\_CONFIG\_INCLUDE\_STATIC\_LOADER #define OSAL\_CONFIG\_INCLUDE\_STATIC\_LOADER

Definition at line 23 of file osconfig.h.

Definition at line 172 of file common\_types.h.

Definition at line 173 of file common\_types.h.

Definition at line 174 of file common\_types.h.

Definition at line 171 of file common\_types.h.

Definition at line 175 of file common\_types.h.

# 7.5.3 Typedef Documentation

# 7.5.3.1 cpuaddr typedef uintptr\_t cpuaddr

Definition at line 88 of file common\_types.h.

# **7.5.3.2 cpudiff** typedef ptrdiff\_t cpudiff

Definition at line 90 of file common\_types.h.

# **7.5.3.3 cpusize** typedef size\_t cpusize

Definition at line 89 of file common\_types.h.

**7.5.3.4 int16** typedef int16\_t int16

Definition at line 80 of file common types.h.

**7.5.3.5 int32** typedef int32\_t int32

Definition at line 81 of file common\_types.h.

**7.5.3.6** int64 typedef int64\_t int64

Definition at line 82 of file common\_types.h.

7.5.3.7 int8 typedef int8\_t int8

Definition at line 79 of file common\_types.h.

 $\textbf{7.5.3.8} \quad \textbf{intptr} \quad \texttt{typedef intptr\_t intptr}$ 

Definition at line 87 of file common\_types.h.

**7.5.3.9 OS\_ArgCallback\_t** typedef void(\* OS\_ArgCallback\_t) (osal\_id\_t object\_id, void \*arg)

General purpose OSAL callback function.

This may be used by multiple APIS

Definition at line 143 of file common\_types.h.

 $\textbf{7.5.3.10} \quad \textbf{osal\_blockcount\_t} \quad \texttt{typedef size\_t osal\_blockcount\_t}$ 

A type used to represent a number of blocks or buffers

This is used with file system and queue implementations.

Definition at line 116 of file common\_types.h.

```
7.5.3.11 osal_id_t typedef uint32 osal_id_t
```

A type to be used for OSAL resource identifiers. This typedef is backward compatible with the IDs from older versions of OSAL

Definition at line 108 of file common\_types.h.

```
7.5.3.12 osal_index_t typedef uint32 osal_index_t
```

A type used to represent an index into a table structure

This is used when referring directly to a table index as opposed to an object ID. It is primarily intended for internal use, but is also output from public APIs such as OS\_ObjectIdToArrayIndex().

Definition at line 126 of file common\_types.h.

```
7.5.3.13 osal_objtype_t typedef uint32 osal_objtype_t
```

A type used to represent the runtime type or category of an OSAL object

Definition at line 131 of file common types.h.

```
7.5.3.14 osal_status_t typedef int32 osal_status_t
```

The preferred type to represent OSAL status codes defined in osapi-error.h

Definition at line 136 of file common\_types.h.

```
7.5.3.15 uint16 typedef uint16_t uint16
```

Definition at line 84 of file common\_types.h.

**7.5.3.16 uint32** typedef uint32\_t uint32

Definition at line 85 of file common\_types.h.

```
7.5.3.17 uint64 typedef uint64_t uint64
```

Definition at line 86 of file common\_types.h.

```
7.5.3.18 uint8 typedef uint8_t uint8
```

Definition at line 83 of file common types.h.

#### 7.5.4 Function Documentation

# 7.6 osal/src/os/inc/osapi-binsem.h File Reference

```
#include "osconfig.h"
#include "common_types.h"
```

#### **Data Structures**

struct OS\_bin\_sem\_prop\_t
 OSAL binary semaphore properties.

### **Macros**

#define OS\_SEM\_FULL 1
 Semaphore full state.
 #define OS\_SEM\_EMPTY 0
 Semaphore empty state.

#### **Functions**

- int32 OS\_BinSemCreate (osal\_id\_t \*sem\_id, const char \*sem\_name, uint32 sem\_initial\_value, uint32 options)

  Creates a binary semaphore.
- int32 OS\_BinSemFlush (osal\_id\_t sem\_id)

Unblock all tasks pending on the specified semaphore.

int32 OS\_BinSemGive (osal\_id\_t sem\_id)

Increment the semaphore value.

int32 OS\_BinSemTake (osal\_id\_t sem\_id)

Decrement the semaphore value.

int32 OS\_BinSemTimedWait (osal\_id\_t sem\_id, uint32 msecs)

Decrement the semaphore value with a timeout.

int32 OS\_BinSemDelete (osal\_id\_t sem\_id)

Deletes the specified Binary Semaphore.

• int32 OS\_BinSemGetIdByName (osal\_id\_t \*sem\_id, const char \*sem\_name)

Find an existing semaphore ID by name.

• int32 OS\_BinSemGetInfo (osal\_id\_t sem\_id, OS\_bin\_sem\_prop\_t \*bin\_prop)

Fill a property object buffer with details regarding the resource.

### 7.6.1 Detailed Description

Declarations and prototypes for binary semaphores

# 7.7 osal/src/os/inc/osapi-bsp.h File Reference

```
#include "osconfig.h"
#include "common_types.h"
```

### **Functions**

- void OS BSP SetResourceTypeConfig (uint32 ResourceType, uint32 ConfigOptionValue)
- uint32 OS\_BSP\_GetResourceTypeConfig (uint32 ResourceType)
- uint32 OS\_BSP\_GetArgC (void)
- char \*const \* OS\_BSP\_GetArgV (void)
- void OS\_BSP\_SetExitCode (int32 code)

### 7.7.1 Detailed Description

Declarations and prototypes for OSAL BSP

# 7.8 osal/src/os/inc/osapi-clock.h File Reference

```
#include "osconfig.h"
#include "common_types.h"
```

#### **Data Structures**

• struct OS time t

OSAL time interval structure.

#### **Enumerations**

enum { OS\_TIME\_TICK\_RESOLUTION\_NS = 100, OS\_TIME\_TICKS\_PER\_SECOND = 1000000000 / OS\_TI

 ME\_TICK\_RESOLUTION\_NS, OS\_TIME\_TICKS\_PER\_MSEC = 1000000 / OS\_TIME\_TICK\_RESOLUTION\_
 NS, OS\_TIME\_TICKS\_PER\_USEC = 1000 / OS\_TIME\_TICK\_RESOLUTION\_NS }

Multipliers/divisors to convert ticks into standardized units.

#### **Functions**

int32 OS\_GetLocalTime (OS\_time\_t \*time\_struct)

Get the local time.

int32 OS\_SetLocalTime (const OS\_time\_t \*time\_struct)

Set the local time.

static int64 OS\_TimeGetTotalSeconds (OS\_time\_t tm)

Get interval from an OS\_time\_t object normalized to whole number of seconds.

static OS\_time\_t OS\_TimeFromTotalSeconds (int64 tm)

Get an OS\_time\_t interval object from an integer number of seconds.

static int64 OS\_TimeGetTotalMilliseconds (OS\_time\_t tm)

Get interval from an OS\_time\_t object normalized to millisecond units.

static OS\_time\_t OS\_TimeFromTotalMilliseconds (int64 tm)

Get an OS\_time\_t interval object from a integer number of milliseconds.

static int64 OS TimeGetTotalMicroseconds (OS time t tm)

Get interval from an OS time t object normalized to microsecond units.

static OS time t OS TimeFromTotalMicroseconds (int64 tm)

Get an OS\_time\_t interval object from a integer number of microseconds.

static int64 OS TimeGetTotalNanoseconds (OS time t tm)

Get interval from an OS\_time\_t object normalized to nanosecond units.

static OS time t OS TimeFromTotalNanoseconds (int64 tm)

Get an OS\_time\_t interval object from a integer number of nanoseconds.

static int64 OS TimeGetFractionalPart (OS time t tm)

Get subseconds portion (fractional part only) from an OS\_time\_t object.

static uint32 OS\_TimeGetSubsecondsPart (OS\_time\_t tm)

Get 32-bit normalized subseconds (fractional part only) from an OS\_time\_t object.

static uint32 OS\_TimeGetMillisecondsPart (OS\_time\_t tm)

Get milliseconds portion (fractional part only) from an OS\_time\_t object.

static uint32 OS\_TimeGetMicrosecondsPart (OS\_time\_t tm)

Get microseconds portion (fractional part only) from an OS time t object.

static uint32 OS TimeGetNanosecondsPart (OS time t tm)

Get nanoseconds portion (fractional part only) from an OS\_time\_t object.

static OS\_time\_t OS\_TimeAssembleFromNanoseconds (int64 seconds, uint32 nanoseconds)

Assemble/Convert a number of seconds + nanoseconds into an OS\_time\_t interval.

static OS time t OS TimeAssembleFromMicroseconds (int64 seconds, uint32 microseconds)

Assemble/Convert a number of seconds + microseconds into an OS\_time\_t interval.

static OS time t OS TimeAssembleFromMilliseconds (int64 seconds, uint32 milliseconds)

Assemble/Convert a number of seconds + milliseconds into an OS\_time\_t interval.

static OS time t OS TimeAssembleFromSubseconds (int64 seconds, uint32 subseconds)

Assemble/Convert a number of seconds + subseconds into an OS\_time\_t interval.

static OS\_time\_t OS\_TimeAdd (OS\_time\_t time1, OS\_time\_t time2)

Computes the sum of two time intervals.

static OS\_time\_t OS\_TimeSubtract (OS\_time\_t time1, OS\_time\_t time2)

Computes the difference between two time intervals.

#### 7.8.1 Detailed Description

Declarations and prototypes for osapi-clock module

#### 7.8.2 Enumeration Type Documentation

## 7.8.2.1 anonymous enum anonymous enum

Multipliers/divisors to convert ticks into standardized units.

Various fixed conversion factor constants used by the conversion routines

A 100ns tick time allows max intervals of about +/- 14000 years in a 64-bit signed integer value.

### Note

Applications should not directly use these values, but rather use conversion routines below to obtain standardized units (seconds/microseconds/etc).

#### Enumerator

	OS_TIME_TICK_RESOLUTION_NS	
	OS_TIME_TICKS_PER_SECOND	
	OS_TIME_TICKS_PER_MSEC	
ĺ	OS_TIME_TICKS_PER_USEC	

Definition at line 61 of file osapi-clock.h.

# 7.9 osal/src/os/inc/osapi-common.h File Reference

```
#include "osconfig.h"
#include "common_types.h"
```

# **Typedefs**

• typedef int32(\* OS\_EventHandler\_t) (OS\_Event\_t event, osal\_id\_t object\_id, void \*data)

A callback routine for event handling.

#### **Enumerations**

```
    enum OS_Event_t {
        OS_EVENT_RESERVED = 0, OS_EVENT_RESOURCE_ALLOCATED, OS_EVENT_RESOURCE_CREATED,
        OS_EVENT_RESOURCE_DELETED,
        OS_EVENT_TASK_STARTUP, OS_EVENT_MAX }
```

A set of events that can be used with BSP event callback routines.

#### **Functions**

void OS\_Application\_Startup (void)

Application startup.

• void OS\_Application\_Run (void)

Application run.

• int32 OS\_API\_Init (void)

Initialization of API.

· void OS API Teardown (void)

Teardown/de-initialization of OSAL API.

void OS\_IdleLoop (void)

Background thread implementation - waits forever for events to occur.

void OS DeleteAllObjects (void)

delete all resources created in OSAL.

void OS\_ApplicationShutdown (uint8 flag)

Initiate orderly shutdown.

void OS\_ApplicationExit (int32 Status)

Exit/Abort the application.

• int32 OS\_RegisterEventHandler (OS\_EventHandler\_t handler)

Callback routine registration.

# 7.9.1 Detailed Description

Declarations and prototypes for general OSAL functions that are not part of a subsystem

# 7.9.2 Typedef Documentation

**7.9.2.1 OS\_EventHandler\_t** typedef int32(\* OS\_EventHandler\_t) (OS\_Event\_t event, osal\_id\_t object ← \_id, void \*data)

A callback routine for event handling.

### **Parameters**

in	event	The event that occurred
in	object  The associated object_id, or 0 if not associated with an object	
	_id	
in,out	data	An abstract data/context object associated with the event, or NULL.

### Returns

status Execution status, see OSAL Return Code Defines.

Definition at line 98 of file osapi-common.h.

# 7.9.3 Enumeration Type Documentation

# 7.9.3.1 OS\_Event\_t enum OS\_Event\_t

A set of events that can be used with BSP event callback routines.

#### Enumerator

OS_EVENT_RESERVED	no-op/reserved event id value
OS_EVENT_RESOURCE_ALLOCATED	resource/id has been newly allocated but not yet created.  This event is invoked from WITHIN the locked region, in the context of the task which is allocating the resource.  If the handler returns non-success, the error will be returned to the caller and the creation process is aborted.
OS_EVENT_RESOURCE_CREATED	resource/id has been fully created/finalized. Invoked outside locked region, in the context of the task which created the resource. Data object is not used, passed as NULL. Return value is ignored - this is for information purposes only.
OS_EVENT_RESOURCE_DELETED	resource/id has been deleted. Invoked outside locked region, in the context of the task which deleted the resource. Data object is not used, passed as NULL. Return value is ignored - this is for information purposes only.

Generated by Doxygen

#### Enumerator

OS_EVENT_TASK_STARTUP	New task is starting. Invoked outside locked region, in the context of the task which is currently starting, before the entry point is called. Data object is not used, passed as NULL. If the handler returns non-success, task startup is aborted and the entry point is not called.
OS_EVENT_MAX	placeholder for end of enum, not used

Definition at line 34 of file osapi-common.h.

# 7.10 osal/src/os/inc/osapi-condvar.h File Reference

```
#include "osconfig.h"
#include "common_types.h"
#include "osapi-clock.h"
```

#### **Data Structures**

struct OS\_condvar\_prop\_t
 OSAL condition variable properties.

#### **Functions**

• int32 OS\_CondVarCreate (osal\_id\_t \*var\_id, const char \*var\_name, uint32 options)

Creates a condition variable resource.

int32 OS\_CondVarLock (osal\_id\_t var\_id)

Locks/Acquires the underlying mutex associated with a condition variable.

• int32 OS\_CondVarUnlock (osal\_id\_t var\_id)

Unlocks/Releases the underlying mutex associated with a condition variable.

int32 OS\_CondVarSignal (osal\_id\_t var\_id)

Signals the condition variable resource referenced by var\_id.

int32 OS\_CondVarBroadcast (osal\_id\_t var\_id)

Broadcasts the condition variable resource referenced by var\_id.

int32 OS\_CondVarWait (osal\_id\_t var\_id)

Waits on the condition variable object referenced by var\_id.

• int32 OS\_CondVarTimedWait (osal\_id\_t var\_id, const OS\_time\_t \*abs\_wakeup\_time)

Time-limited wait on the condition variable object referenced by var\_id.

• int32 OS\_CondVarDelete (osal\_id\_t var\_id)

Deletes the specified condition variable.

• int32 OS\_CondVarGetIdByName (osal\_id\_t \*var\_id, const char \*var\_name)

Find an existing condition variable ID by name.

int32 OS\_CondVarGetInfo (osal\_id\_t var\_id, OS\_condvar\_prop\_t \*condvar\_prop)

Fill a property object buffer with details regarding the resource.

# 7.10.1 Detailed Description

Declarations and prototypes for condition variables

# 7.11 osal/src/os/inc/osapi-constants.h File Reference

```
#include "osconfig.h"
#include "common_types.h"
```

#### **Macros**

- #define OS\_PEND (-1)
- #define OS\_CHECK (0)
- #define OS\_OBJECT\_ID\_UNDEFINED ((osal\_id\_t) {0})

Initializer for the osal\_id\_t type which will not match any valid value.

- #define OS\_OBJECT\_CREATOR\_ANY OS\_OBJECT\_ID\_UNDEFINED
  - Constant that may be passed to OS\_ForEachObject()/OS\_ForEachObjectOfType() to match any creator (i.e. get all objects)
- #define OS\_MAX\_LOCAL\_PATH\_LEN (OS\_MAX\_PATH\_LEN + OS\_FS\_PHYS\_NAME\_LEN)

Maximum length of a local/native path name string.

### 7.11.1 Detailed Description

General constants for OSAL that are shared across subsystems

### 7.11.2 Macro Definition Documentation

```
7.11.2.1 OS_CHECK #define OS_CHECK (0)
```

Definition at line 35 of file osapi-constants.h.

```
7.11.2.2 OS_MAX_LOCAL_PATH_LEN #define OS_MAX_LOCAL_PATH_LEN (OS_MAX_PATH_LEN + OS_FS_PHYS_NAME_LEN)
```

Maximum length of a local/native path name string.

This is a concatenation of the OSAL virtual path with the system mount point or device name

Definition at line 54 of file osapi-constants.h.

```
7.11.2.3 OS_OBJECT_CREATOR_ANY #define OS_OBJECT_CREATOR_ANY OS_OBJECT_ID_UNDEFINED
```

Constant that may be passed to OS\_ForEachObject()/OS\_ForEachObjectOfType() to match any creator (i.e. get all objects)

Definition at line 46 of file osapi-constants.h.

```
7.11.2.4 OS_OBJECT_ID_UNDEFINED #define OS_OBJECT_ID_UNDEFINED ((osal_id_t) {0})
```

Initializer for the osal\_id\_t type which will not match any valid value.

Definition at line 40 of file osapi-constants.h.

```
7.11.2.5 OS_PEND #define OS_PEND (-1)
```

Definition at line 34 of file osapi-constants.h.

### 7.12 osal/src/os/inc/osapi-countsem.h File Reference

```
#include "osconfig.h"
#include "common_types.h"
```

## **Data Structures**

struct OS\_count\_sem\_prop\_t

OSAL counting semaphore properties.

#### **Functions**

- int32 OS\_CountSemCreate (osal\_id\_t \*sem\_id, const char \*sem\_name, uint32 sem\_initial\_value, uint32 options)

  Creates a counting semaphore.
- int32 OS\_CountSemGive (osal\_id\_t sem\_id)

Increment the semaphore value.

int32 OS\_CountSemTake (osal\_id\_t sem\_id)

Decrement the semaphore value.

• int32 OS\_CountSemTimedWait (osal\_id\_t sem\_id, uint32 msecs)

Decrement the semaphore value with timeout.

int32 OS\_CountSemDelete (osal\_id\_t sem\_id)

Deletes the specified counting Semaphore.

• int32 OS\_CountSemGetIdByName (osal\_id\_t \*sem\_id, const char \*sem\_name)

Find an existing semaphore ID by name.

• int32 OS\_CountSemGetInfo (osal\_id\_t sem\_id, OS\_count\_sem\_prop\_t \*count\_prop)

Fill a property object buffer with details regarding the resource.

# 7.12.1 Detailed Description

Declarations and prototypes for counting semaphores

# 7.13 osal/src/os/inc/osapi-dir.h File Reference

```
#include "osconfig.h"
#include "common_types.h"
```

#### **Data Structures**

struct os\_dirent\_t
 Directory entry.

#### **Macros**

#define OS\_DIRENTRY\_NAME(x) ((x).FileName)
 Access filename part of the dirent structure.

#### **Functions**

```
    int32 OS_DirectoryOpen (osal_id_t *dir_id, const char *path)
```

Opens a directory.

int32 OS\_DirectoryClose (osal\_id\_t dir\_id)

Closes an open directory.

• int32 OS DirectoryRewind (osal id t dir id)

Rewinds an open directory.

• int32 OS\_DirectoryRead (osal\_id\_t dir\_id, os\_dirent\_t \*dirent)

Reads the next name in the directory.

int32 OS mkdir (const char \*path, uint32 access)

Makes a new directory.

int32 OS\_rmdir (const char \*path)

Removes a directory from the file system.

### 7.13.1 Detailed Description

Declarations and prototypes for directories

### 7.13.2 Macro Definition Documentation

Access filename part of the dirent structure.

Definition at line 38 of file osapi-dir.h.

# 7.14 osal/src/os/inc/osapi-error.h File Reference

```
#include "common_types.h"
```

#### **Macros**

```
• #define OS_ERROR_NAME_LENGTH 35
```

Error string name length.

• #define OS\_STATUS\_STRING\_LENGTH 12

Status converted to string length limit.

• #define OS\_SUCCESS (0)

Successful execution.

• #define OS\_ERROR (-1)

Failed execution.

• #define OS\_INVALID\_POINTER (-2)

Invalid pointer.

• #define OS\_ERROR\_ADDRESS\_MISALIGNED (-3)

Address misalignment.

• #define OS ERROR TIMEOUT (-4)

Error timeout.

• #define OS INVALID INT NUM (-5)

Invalid Interrupt number.

• #define OS\_SEM\_FAILURE (-6)

Semaphore failure.

#define OS SEM TIMEOUT (-7)

Semaphore timeout.

• #define OS\_QUEUE\_EMPTY (-8)

Queue empty.

#define OS\_QUEUE\_FULL (-9)

Queue full.

#define OS\_QUEUE\_TIMEOUT (-10)

Queue timeout.

#define OS\_QUEUE\_INVALID\_SIZE (-11)

Queue invalid size.

• #define OS\_QUEUE\_ID\_ERROR (-12)

Queue ID error.

#define OS\_ERR\_NAME\_TOO\_LONG (-13)

name length including null terminator greater than OS\_MAX\_API\_NAME

```
    #define OS_ERR_NO_FREE_IDS (-14)

     No free IDs.

    #define OS_ERR_NAME_TAKEN (-15)

     Name taken.

    #define OS_ERR_INVALID_ID (-16)

     Invalid ID.

    #define OS_ERR_NAME_NOT_FOUND (-17)

     Name not found.

    #define OS ERR SEM NOT FULL (-18)

     Semaphore not full.

    #define OS_ERR_INVALID_PRIORITY (-19)

     Invalid priority.

    #define OS INVALID SEM VALUE (-20)

     Invalid semaphore value.

    #define OS_ERR_FILE (-27)

     File error.

    #define OS_ERR_NOT_IMPLEMENTED (-28)

     Not implemented.

    #define OS_TIMER_ERR_INVALID_ARGS (-29)

     Timer invalid arguments.

    #define OS_TIMER_ERR_TIMER_ID (-30)

     Timer ID error.

    #define OS_TIMER_ERR_UNAVAILABLE (-31)

     Timer unavailable.
• #define OS_TIMER_ERR_INTERNAL (-32)
     Timer internal error.

    #define OS_ERR_OBJECT_IN_USE (-33)

     Object in use.

    #define OS_ERR_BAD_ADDRESS (-34)

     Bad address.

    #define OS_ERR_INCORRECT_OBJ_STATE (-35)

     Incorrect object state.

    #define OS_ERR_INCORRECT_OBJ_TYPE (-36)

     Incorrect object type.

    #define OS ERR STREAM DISCONNECTED (-37)

     Stream disconnected.

    #define OS_ERR_OPERATION_NOT_SUPPORTED (-38)

     Requested operation not support on supplied object(s)

    #define OS ERR INVALID SIZE (-40)

     Invalid Size.

    #define OS_ERR_OUTPUT_TOO_LARGE (-41)

     Size of output exceeds limit

    #define OS ERR INVALID ARGUMENT (-42)

     Invalid argument value (other than ID or size)

    #define OS_FS_ERR_PATH_TOO_LONG (-103)

     FS path too long.
```

• #define OS\_FS\_ERR\_NAME\_TOO\_LONG (-104)

FS name too long.

#define OS\_FS\_ERR\_DRIVE\_NOT\_CREATED (-106)

FS drive not created.

#define OS FS ERR DEVICE NOT FREE (-107)

FS device not free.

• #define OS\_FS\_ERR\_PATH\_INVALID (-108)

FS path invalid.

### **Typedefs**

typedef char os\_err\_name\_t[OS\_ERROR\_NAME\_LENGTH]

For the OS\_GetErrorName() function, to ensure everyone is making an array of the same length.

typedef char os\_status\_string\_t[OS\_STATUS\_STRING\_LENGTH]

For the OS\_StatusToString() function, to ensure everyone is making an array of the same length.

#### **Functions**

static long OS\_StatusToInteger (osal\_status\_t Status)

Convert a status code to a native "long" type.

• int32 OS\_GetErrorName (int32 error\_num, os\_err\_name\_t \*err\_name)

Convert an error number to a string.

• char \* OS\_StatusToString (osal\_status\_t status, os\_status\_string\_t \*status\_string)

Convert status to a string.

### 7.14.1 Detailed Description

OSAL error code definitions

#### 7.14.2 Macro Definition Documentation

#### 7.14.2.1 OS\_ERROR\_NAME\_LENGTH #define OS\_ERROR\_NAME\_LENGTH 35

Error string name length.

The sizes of strings in OSAL functions are built with this limit in mind. Always check the uses of os\_err\_name\_t when changing this value.

Definition at line 35 of file osapi-error.h.

# 7.14.2.2 OS\_STATUS\_STRING\_LENGTH #define OS\_STATUS\_STRING\_LENGTH 12

Status converted to string length limit.

Used for sizing os\_status\_string\_t intended for use in printing osal\_status\_t values Sized to fit LONG\_MIN including NULL termination

Definition at line 55 of file osapi-error.h.

# 7.14.3 Typedef Documentation

```
7.14.3.1 os_err_name_t typedef char os_err_name_t[OS_ERROR_NAME_LENGTH]
```

For the OS GetErrorName() function, to ensure everyone is making an array of the same length.

Implementation note for developers:

The sizes of strings in OSAL functions are built with this OS\_ERROR\_NAME\_LENGTH limit in mind. Always check the uses of os\_err\_name\_t when changing this value.

Definition at line 47 of file osapi-error.h.

```
7.14.3.2 os_status_string_t typedef char os_status_string_t[OS_STATUS_STRING_LENGTH]
```

For the OS\_StatusToString() function, to ensure everyone is making an array of the same length.

Definition at line 61 of file osapi-error.h.

# 7.15 osal/src/os/inc/osapi-file.h File Reference

```
#include "osconfig.h"
#include "common_types.h"
#include "osapi-clock.h"
```

#### **Data Structures**

```
    struct OS_file_prop_t
    OSAL file properties.
```

• struct os\_fstat\_t

File system status.

#### **Macros**

- #define OS READ ONLY 0
- #define OS\_WRITE\_ONLY 1
- #define OS\_READ\_WRITE 2
- #define OS SEEK SET 0
- #define OS SEEK CUR 1
- #define OS SEEK END 2
- #define OS FILESTAT MODE(x) ((x).FileModeBits)

Access file stat mode bits.

#define OS\_FILESTAT\_ISDIR(x) ((x).FileModeBits & OS\_FILESTAT\_MODE\_DIR)

File stat is directory logical.

#define OS\_FILESTAT\_EXEC(x) ((x).FileModeBits & OS\_FILESTAT\_MODE\_EXEC)

File stat is executable logical.

#define OS FILESTAT WRITE(x) ((x).FileModeBits & OS FILESTAT MODE WRITE)

File stat is write enabled logical.

#define OS\_FILESTAT\_READ(x) ((x).FileModeBits & OS\_FILESTAT\_MODE\_READ)

File stat is read enabled logical.

#define OS\_FILESTAT\_SIZE(x) ((x).FileSize)

Access file stat size field.

#define OS\_FILESTAT\_TIME(x) (OS\_TimeGetTotalSeconds((x).FileTime))

Access file stat time field as a whole number of seconds.

#### **Enumerations**

enum { OS\_FILESTAT\_MODE\_EXEC = 0x00001, OS\_FILESTAT\_MODE\_WRITE = 0x00002, OS\_FILESTAT\_MODE\_READ = 0x00004, OS\_FILESTAT\_MODE\_DIR = 0x10000 }

File stat mode bits.

enum OS\_file\_flag\_t { OS\_FILE\_FLAG\_NONE = 0x00, OS\_FILE\_FLAG\_CREATE = 0x01, OS\_FILE\_FLAG\_TRUNCATE = 0x02 }

Flags that can be used with opening of a file (bitmask)

# **Functions**

• int32 OS OpenCreate (osal id t \*filedes, const char \*path, int32 flags, int32 access mode)

Open or create a file.

int32 OS\_close (osal\_id\_t filedes)

Closes an open file handle.

int32 OS\_read (osal\_id\_t filedes, void \*buffer, size\_t nbytes)

Read from a file handle.

int32 OS\_write (osal\_id\_t filedes, const void \*buffer, size\_t nbytes)

Write to a file handle.

int32 OS TimedRead (osal id t filedes, void \*buffer, size t nbytes, int32 timeout)

File/Stream input read with a timeout.

int32 OS TimedWrite (osal id t filedes, const void \*buffer, size t nbytes, int32 timeout)

File/Stream output write with a timeout.

int32 OS chmod (const char \*path, uint32 access mode)

Changes the permissions of a file.

int32 OS\_stat (const char \*path, os\_fstat\_t \*filestats)

Obtain information about a file or directory.

int32 OS\_lseek (osal\_id\_t filedes, int32 offset, uint32 whence)

Seeks to the specified position of an open file.

int32 OS remove (const char \*path)

Removes a file from the file system.

• int32 OS\_rename (const char \*old\_filename, const char \*new\_filename)

Renames a file

int32 OS cp (const char \*src, const char \*dest)

Copies a single file from src to dest.

int32 OS mv (const char \*src, const char \*dest)

Move a single file from src to dest.

int32 OS\_FDGetInfo (osal\_id\_t filedes, OS\_file\_prop\_t \*fd\_prop)

Obtain information about an open file.

int32 OS FileOpenCheck (const char \*Filename)

Checks to see if a file is open.

• int32 OS\_CloseAllFiles (void)

Close all open files.

int32 OS CloseFileByName (const char \*Filename)

Close a file by filename.

### 7.15.1 Detailed Description

File stat is write enabled logical.

Definition at line 94 of file osapi-file.h.

# 7.15.3 Enumeration Type Documentation

### 7.15.3.1 anonymous enum anonymous enum

File stat mode bits.

We must also define replacements for the stat structure's mode bits. This is currently just a small subset since the OSAL just presents a very simplified view of the filesystem to the upper layers. And since not all OS'es are POSIX, the more POSIX-specific bits are not relevant anyway.

### Enumerator

OS_FILESTAT_MODE_EXEC	
OS_FILESTAT_MODE_WRITE	
OS_FILESTAT_MODE_READ	
OS_FILESTAT_MODE_DIR	

Definition at line 79 of file osapi-file.h.

```
\textbf{7.15.3.2} \quad \textbf{OS\_file\_flag\_t} \quad \texttt{enum OS\_file\_flag\_t}
```

Flags that can be used with opening of a file (bitmask)

# **Data Structures**

- struct os\_fsinfo\_t

  OSAL file system info.
- struct OS\_statvfs\_t

#### **Macros**

- #define OS\_CHK\_ONLY 0
- #define OS\_REPAIR 1

#### **Functions**

• int32 OS FileSysAddFixedMap (osal\_id\_t \*filesys\_id, const char \*phys\_path, const char \*virt\_path)

Create a fixed mapping between an existing directory and a virtual OSAL mount point.

 int32 OS\_mkfs (char \*address, const char \*devname, const char \*volname, size\_t blocksize, osal\_blockcount\_t numblocks)

Makes a file system on the target.

• int32 OS\_mount (const char \*devname, const char \*mountpoint)

Mounts a file system.

int32 OS\_initfs (char \*address, const char \*devname, const char \*volname, size\_t blocksize, osal\_blockcount\_t numblocks)

Initializes an existing file system.

int32 OS rmfs (const char \*devname)

Removes a file system.

int32 OS\_unmount (const char \*mountpoint)

Unmounts a mounted file system.

int32 OS FileSysStatVolume (const char \*name, OS statvfs t \*statbuf)

Obtains information about size and free space in a volume.

int32 OS chkfs (const char \*name, bool repair)

Checks the health of a file system and repairs it if necessary.

• int32 OS\_FS\_GetPhysDriveName (char \*PhysDriveName, const char \*MountPoint)

Obtains the physical drive name associated with a mount point.

• int32 OS\_TranslatePath (const char \*VirtualPath, char \*LocalPath)

Translates an OSAL Virtual file system path to a host Local path.

int32 OS\_GetFsInfo (os\_fsinfo\_t \*filesys\_info)

Returns information about the file system.

# 7.16.1 Detailed Description

Object condition variable type.

#define OS\_OBJECT\_TYPE\_USER 0x10

Object user type.

#### **Functions**

static unsigned long OS ObjectIdToInteger (osal id t object id)

Obtain an integer value corresponding to an object ID.

static osal id t OS ObjectIdFromInteger (unsigned long value)

Obtain an osal ID corresponding to an integer value.

static bool OS\_ObjectIdEqual (osal\_id\_t object\_id1, osal\_id\_t object\_id2)

Check two OSAL object ID values for equality.

static bool OS\_ObjectIdDefined (osal\_id\_t object\_id)

Check if an object ID is defined.

- int32 OS\_GetResourceName (osal\_id\_t object\_id, char \*buffer, size\_t buffer\_size)
  - Obtain the name of an object given an arbitrary object ID.
- osal objtype t OS IdentifyObject (osal id t object id)

Obtain the type of an object given an arbitrary object ID.

int32 OS ConvertToArrayIndex (osal id t object id, osal index t \*ArrayIndex)

Converts an abstract ID into a number suitable for use as an array index.

• int32 OS\_ObjectIdToArrayIndex (osal\_objtype\_t idtype, osal\_id\_t object\_id, osal\_index\_t \*ArrayIndex)

Converts an abstract ID into a number suitable for use as an array index.

 $\bullet \ \ void\ OS\_For Each Object\ (osal\_id\_t\ creator\_id,\ OS\_Arg Callback\_t\ callback\_ptr,\ void\ *callback\_arg)$ 

call the supplied callback function for all valid object IDs

 void OS\_ForEachObjectOfType (osal\_objtype\_t objtype, osal\_id\_t creator\_id, OS\_ArgCallback\_t callback\_ptr, void \*callback arg)

call the supplied callback function for valid object IDs of a specific type

## 7.18.1 Detailed Description

Declarations and prototypes for object IDs

#include <string.h>
#include "osconfig.h"
#include "common_types.h"
#include "osapi-printf.h"
```

#### **Macros**

- #define BUGREPORT(...) OS printf( VA ARGS )
- #define BUGCHECK(cond, errcode)

Basic Bug-Checking macro.

• #define ARGCHECK(cond, errcode)

Generic argument checking macro for non-critical values.

• #define LENGTHCHECK(str, len, errcode) ARGCHECK(memchr(str, '\0', len), errcode)

String length limit check macro.

• #define BUGCHECK\_VOID(cond) BUGCHECK(cond, )

Bug-Check macro for void functions.

## 7.19.1 Detailed Description

Macro definitions that are used across all OSAL subsystems

#### 7.19.2 Macro Definition Documentation

Generic argument checking macro for non-critical values.

This macro checks a conditional that is expected to be true, and return a value if it evaluates false.

ARGCHECK can be used to check for out of range or other invalid argument conditions which may (validly) occur at runtime and do not necessarily indicate bugs in the application.

These argument checks are NOT considered fatal errors. The application continues to run normally. This does not report the error on the console.

As such, ARGCHECK actions are always compiled in - not selectable at compile-time.

See also

**BUGCHECK** for checking critical values that indicate bugs

Definition at line 131 of file osapi-macros.h.

# 7.19.2.2 BUGCHECK #define BUGCHECK( cond, errcode)

#### Value:

```
if (!(cond))
{
    BUGREPORT("\n**BUG** %s():%d:check \'%s\' FAILED --> %s\n\n", __func__, __LINE__, #cond, #errcode); \
    return errcode;
}
```

Basic Bug-Checking macro.

This macro checks a conditional, and if it is FALSE, then it generates a report - which may in turn contain additional actions.

BUGCHECK should only be used for conditions which are critical and must always be true. If such a condition is ever false then it indicates a bug in the application which must be resolved. It may or may not be possible to continue operation if a bugcheck fails.

See also

**ARGCHECK** for checking non-critical values

Definition at line 105 of file osapi-macros.h.

```
7.19.2.3 BUGCHECK_VOID #define BUGCHECK_VOID(

cond ) BUGCHECK(cond, )
```

Bug-Check macro for void functions.

The basic BUGCHECK macro returns a value, which needs to be empty for functions that do not have a return value. In this case the second argument (errcode) is intentionally left blank.

Definition at line 155 of file osapi-macros.h.

```
7.19.2.4 BUGREPORT #define BUGREPORT(
... ) OS_printf(__VA_ARGS__)
```

Definition at line 88 of file osapi-macros.h.

## 7.19.2.5 LENGTHCHECK #define LENGTHCHECK(

```
str,
len,
errcode ) ARGCHECK(memchr(str, '\0', len), errcode)
```

String length limit check macro.

This macro is a specialized version of ARGCHECK that confirms a string will fit into a buffer of the specified length, and return an error code if it will not.

Note

this uses ARGCHECK, thus treating a string too long as a normal runtime (i.e. non-bug) error condition with a typical error return to the caller.

Definition at line 146 of file osapi-macros.h.

## 7.20 osal/src/os/inc/osapi-module.h File Reference

```
#include "osconfig.h"
#include "common_types.h"
```

#### **Data Structures**

struct OS\_module\_address\_t

OSAL module address properties.

struct OS\_module\_prop\_t

OSAL module properties.

struct OS\_static\_symbol\_record\_t

Associates a single symbol name with a memory address.

#### **Macros**

• #define OS MODULE FLAG GLOBAL SYMBOLS 0x00

Requests OS\_ModuleLoad() to add the symbols to the global symbol table.

• #define OS MODULE FLAG LOCAL SYMBOLS 0x01

Requests OS\_ModuleLoad() to keep the symbols local/private to this module.

#### **Functions**

int32 OS\_SymbolLookup (cpuaddr \*symbol\_address, const char \*symbol\_name)

Find the Address of a Symbol.

- int32 OS\_ModuleSymbolLookup (osal\_id\_t module\_id, cpuaddr \*symbol\_address, const char \*symbol\_name)

  Find the Address of a Symbol within a module.
- int32 OS SymbolTableDump (const char \*filename, size t size limit)

Dumps the system symbol table to a file.

- int32 OS\_ModuleLoad (osal\_id\_t \*module\_id, const char \*module\_name, const char \*filename, uint32 flags)

  Loads an object file.
- int32 OS ModuleUnload (osal id t module id)

Unloads the module file.

int32 OS\_ModuleInfo (osal\_id\_t module\_id, OS\_module\_prop\_t \*module\_info)

Obtain information about a module.

## 7.20.1 Detailed Description

Declarations and prototypes for module subsystem

#### 7.20.2 Macro Definition Documentation

## 7.20.2.1 OS\_MODULE\_FLAG\_GLOBAL\_SYMBOLS #define OS\_MODULE\_FLAG\_GLOBAL\_SYMBOLS 0x00

Requests OS\_ModuleLoad() to add the symbols to the global symbol table.

When supplied as the "flags" argument to OS\_ModuleLoad(), this indicates that the symbols in the loaded module should be added to the global symbol table. This will make symbols in this library available for use when resolving symbols in future module loads.

This is the default mode of operation for OS ModuleLoad().

Note

On some operating systems, use of this option may make it difficult to unload the module in the future, if the symbols are in use by other entities.

Definition at line 49 of file osapi-module.h.

### 7.20.2.2 OS MODULE FLAG LOCAL SYMBOLS #define OS\_MODULE\_FLAG\_LOCAL\_SYMBOLS 0x01

Requests OS ModuleLoad() to keep the symbols local/private to this module.

When supplied as the "flags" argument to OS\_ModuleLoad(), this indicates that the symbols in the loaded module should NOT be added to the global symbol table. This means the symbols in the loaded library will not be available for use by other modules.

Use this option is recommended for cases where no other entities will need to reference symbols within this module. This helps ensure that the module can be more safely unloaded in the future, by preventing other modules from binding to it. It also helps reduce the likelihood of symbol name conflicts among modules.

Note

To look up symbols within a module loaded with this flag, use OS\_SymbolLookupInModule() instead of OS\_SymbolLookup(). Also note that references obtained using this method are not tracked by the OS; the application must ensure that all references obtained in this manner have been cleaned up/released before unloading the module.

Definition at line 71 of file osapi-module.h.

## 7.21 osal/src/os/inc/osapi-mutex.h File Reference

```
#include "osconfig.h"
#include "common_types.h"
```

#### **Data Structures**

struct OS\_mut\_sem\_prop\_t
 OSAL mutex properties.

#### **Functions**

• int32 OS\_MutSemCreate (osal\_id\_t \*sem\_id, const char \*sem\_name, uint32 options)

Creates a mutex semaphore.

int32 OS\_MutSemGive (osal\_id\_t sem\_id)

Releases the mutex object referenced by sem\_id.

int32 OS\_MutSemTake (osal\_id\_t sem\_id)

Acquire the mutex object referenced by sem\_id.

int32 OS\_MutSemDelete (osal\_id\_t sem\_id)

Deletes the specified Mutex Semaphore.

int32 OS\_MutSemGetIdByName (osal\_id\_t \*sem\_id, const char \*sem\_name)

Find an existing mutex ID by name.

int32 OS\_MutSemGetInfo (osal\_id\_t sem\_id, OS\_mut\_sem\_prop\_t \*mut\_prop)

Fill a property object buffer with details regarding the resource.

## 7.21.1 Detailed Description

Declarations and prototypes for mutexes

## 7.22 osal/src/os/inc/osapi-network.h File Reference

```
#include "osconfig.h"
#include "common_types.h"
```

## **Functions**

int32 OS\_NetworkGetID (void)

Gets the network ID of the local machine.

• int32 OS\_NetworkGetHostName (char \*host\_name, size\_t name\_len)

Gets the local machine network host name.

## 7.22.1 Detailed Description

Declarations and prototypes for network subsystem

## 7.23 osal/src/os/inc/osapi-printf.h File Reference

```
#include "osconfig.h"
#include "common_types.h"
```

#### **Functions**

```
    void OS_printf (const char *string,...) OS_PRINTF(1
```

Abstraction for the system printf() call.

void void OS\_printf\_disable (void)

This function disables the output from OS printf.

void OS\_printf\_enable (void)

This function enables the output from OS printf.

## 7.23.1 Detailed Description

Declarations and prototypes for printf/console output

## 7.24 osal/src/os/inc/osapi-queue.h File Reference

```
#include "osconfig.h"
#include "common_types.h"
```

### **Data Structures**

struct OS\_queue\_prop\_t
 OSAL queue properties.

#### **Functions**

int32 OS\_QueueCreate (osal\_id\_t \*queue\_id, const char \*queue\_name, osal\_blockcount\_t queue\_depth, size
 —t data\_size, uint32 flags)

Create a message queue.

• int32 OS\_QueueDelete (osal\_id\_t queue\_id)

Deletes the specified message queue.

int32 OS QueueGet (osal id t queue id, void \*data, size t size, size t \*size copied, int32 timeout)

Receive a message on a message queue.

• int32 OS QueuePut (osal id t queue id, const void \*data, size t size, uint32 flags)

Put a message on a message queue.

int32 OS QueueGetIdByName (osal id t \*queue id, const char \*queue name)

Find an existing queue ID by name.

int32 OS\_QueueGetInfo (osal\_id\_t queue\_id, OS\_queue\_prop\_t \*queue\_prop)

Fill a property object buffer with details regarding the resource.

## 7.24.1 Detailed Description

Declarations and prototypes for queue subsystem

## 7.25 osal/src/os/inc/osapi-select.h File Reference

```
#include "osconfig.h"
#include "common_types.h"
```

#### **Data Structures**

struct OS FdSet

An abstract structure capable of holding several OSAL IDs.

#### **Enumerations**

```
    enum OS_StreamState_t {
        OS_STREAM_STATE_BOUND = 0x01, OS_STREAM_STATE_CONNECTED = 0x02, OS_STREAM_STATE_READABLE
        = 0x04, OS_STREAM_STATE_WRITABLE = 0x08,
        OS_STREAM_STATE_LISTENING = 0x10 }
```

For the OS\_SelectSingle() function's in/out StateFlags parameter, the state(s) of the stream and the result of the select is a combination of one or more of these states.

#### **Functions**

int32 OS\_SelectMultiple (OS\_FdSet \*ReadSet, OS\_FdSet \*WriteSet, int32 msecs)

Wait for events across multiple file handles.

int32 OS\_SelectSingle (osal\_id\_t objid, uint32 \*StateFlags, int32 msecs)

Wait for events on a single file handle.

• int32 OS\_SelectFdZero (OS\_FdSet \*Set)

Clear a FdSet structure.

int32 OS\_SelectFdAdd (OS\_FdSet \*Set, osal\_id\_t objid)

Add an ID to an FdSet structure.

• int32 OS SelectFdClear (OS FdSet \*Set, osal id t objid)

Clear an ID from an FdSet structure.

bool OS\_SelectFdlsSet (const OS\_FdSet \*Set, osal\_id\_t objid)

Check if an FdSet structure contains a given ID.

## 7.25.1 Detailed Description

Declarations and prototypes for select abstraction

## 7.25.2 Enumeration Type Documentation

## 7.25.2.1 OS\_StreamState\_t enum OS\_StreamState\_t

For the OS\_SelectSingle() function's in/out StateFlags parameter, the state(s) of the stream and the result of the select is a combination of one or more of these states.

#### See also

OS\_SelectSingle()

## Enumerator

OS STREAM STATE BOUND	whether the stream is bound
OO_OTTLEANI_OTATE_DOOND	whether the stream is bound
OS STREAM STATE CONNECTED	whether the stream is connected
00_0111E/1101_01/11E_001111E01EB	Whother the stream is connected
OS STREAM STATE READABLE	whether the stream is readable
OO_OTTLANI_STATE_TILADADLE	whether the stream is readable
OS STREAM STATE WRITABLE	whether the stream is writable
OO_OTTLE/IIVI_OT/TTE_WITHT/IDEE	Whother the stream is writable
OS STREAM STATE LISTENING	whether the stream is listening
OO_OTTLE/IIVI_OT/TTE_EIOTEIVIIVO	which the stream is listering

Definition at line 55 of file osapi-select.h.

## 7.26 osal/src/os/inc/osapi-shell.h File Reference

```
#include "osconfig.h"
#include "common_types.h"
```

## **Functions**

• int32 OS\_ShellOutputToFile (const char \*Cmd, osal\_id\_t filedes)

Executes the command and sends output to a file.

## 7.26.1 Detailed Description

Declarations and prototypes for shell abstraction

## 7.27 osal/src/os/inc/osapi-sockets.h File Reference

```
#include "osconfig.h"
#include "common_types.h"
```

#### **Data Structures**

· union OS SockAddrData t

Storage buffer for generic network address.

· struct OS SockAddr t

Encapsulates a generic network address.

struct OS\_socket\_prop\_t

Encapsulates socket properties.

#### **Macros**

#define OS\_SOCKADDR\_MAX\_LEN 28

#### **Enumerations**

 enum OS\_SocketDomain\_t { OS\_SocketDomain\_INVALID, OS\_SocketDomain\_INET, OS\_SocketDomain\_INET6, OS\_SocketDomain\_MAX }

Socket domain.

 enum OS\_SocketType\_t { OS\_SocketType\_INVALID, OS\_SocketType\_DATAGRAM, OS\_SocketType\_STREAM, OS\_SocketType\_MAX }

Socket type.

 $\bullet \ \, \text{enum OS\_SocketShutdownMode\_t } \\ \{ \ \, \text{OS\_SocketShutdownMode\_NONE} = 0, \ \, \text{OS\_SocketShutdownMode\_SHUT\_READ} \\ = 1, \ \, \text{OS\_SocketShutdownMode\_SHUT\_WRITE} = 2, \ \, \text{OS\_SocketShutdownMode\_SHUT\_READWRITE} = 3 \\ \} \\$ 

Shutdown Mode.

### **Functions**

• int32 OS SocketAddrInit (OS SockAddr t \*Addr, OS SocketDomain t Domain)

Initialize a socket address structure to hold an address of the given family.

int32 OS\_SocketAddrToString (char \*buffer, size\_t buflen, const OS\_SockAddr\_t \*Addr)

Get a string representation of a network host address.

int32 OS\_SocketAddrFromString (OS\_SockAddr\_t \*Addr, const char \*string)

Set a network host address from a string representation.

int32 OS\_SocketAddrGetPort (uint16 \*PortNum, const OS\_SockAddr\_t \*Addr)

Get the port number of a network address.

int32 OS\_SocketAddrSetPort (OS\_SockAddr\_t \*Addr, uint16 PortNum)

Set the port number of a network address.

int32 OS\_SocketOpen (osal\_id\_t \*sock\_id, OS\_SocketDomain\_t Domain, OS\_SocketType\_t Type)

Opens a socket.

int32 OS\_SocketBind (osal\_id\_t sock\_id, const OS\_SockAddr\_t \*Addr)

Binds a socket to a given local address and enter listening (server) mode.

• int32 OS\_SocketListen (osal\_id\_t sock\_id)

Places the specified socket into a listening state.

• int32 OS\_SocketBindAddress (osal\_id\_t sock\_id, const OS\_SockAddr\_t \*Addr)

Binds a socket to a given local address.

• int32 OS\_SocketConnect (osal\_id\_t sock\_id, const OS\_SockAddr\_t \*Addr, int32 timeout)

Connects a socket to a given remote address.

int32 OS\_SocketShutdown (osal\_id\_t sock\_id, OS\_SocketShutdownMode\_t Mode)

Implement graceful shutdown of a stream socket.

int32 OS SocketAccept (osal id t sock id, osal id t \*connsock id, OS SockAddr t \*Addr, int32 timeout)

Waits for and accept the next incoming connection on the given socket.

int32 OS\_SocketRecvFrom (osal\_id\_t sock\_id, void \*buffer, size\_t buflen, OS\_SockAddr\_t \*RemoteAddr, int32 timeout)

Reads data from a message-oriented (datagram) socket.

int32 OS\_SocketSendTo (osal\_id\_t sock\_id, const void \*buffer, size\_t buflen, const OS\_SockAddr\_t \*Remote←
 Addr)

Sends data to a message-oriented (datagram) socket.

int32 OS\_SocketGetIdByName (osal\_id\_t \*sock\_id, const char \*sock\_name)

Gets an OSAL ID from a given name.

int32 OS\_SocketGetInfo (osal\_id\_t sock\_id, OS\_socket\_prop\_t \*sock\_prop)

Gets information about an OSAL Socket ID.

## 7.27.1 Detailed Description

Declarations and prototypes for sockets abstraction

## 7.27.2 Macro Definition Documentation

```
7.27.2.1 OS_SOCKADDR_MAX_LEN #define OS_SOCKADDR_MAX_LEN 28
```

Definition at line 45 of file osapi-sockets.h.

## 7.27.3 Enumeration Type Documentation

## 7.27.3.1 OS\_SocketDomain\_t enum OS\_SocketDomain\_t

Socket domain.

## Enumerator

OS_SocketDomain_INVALID	Invalid.
OS_SocketDomain_INET	IPv4 address family, most commonly used)
OS_SocketDomain_INET6	IPv6 address family, depends on OS/network stack support.
OS_SocketDomain_MAX	Maximum.

Definition at line 60 of file osapi-sockets.h.

## 7.27.3.2 OS\_SocketShutdownMode\_t enum OS\_SocketShutdownMode\_t

Shutdown Mode.

## Enumerator

OS_SocketShutdownMode_NONE	Reserved value, no effect.
OS_SocketShutdownMode_SHUT_READ	Disable future reading.
OS_SocketShutdownMode_SHUT_WRITE	Disable future writing.
OS_SocketShutdownMode_SHUT_READWRITE	Disable future reading or writing.

Definition at line 79 of file osapi-sockets.h.

## 7.27.3.3 OS\_SocketType\_t enum OS\_SocketType\_t

Socket type.

## Enumerator

OS_SocketType_INVALID	Invalid.
OS_SocketType_DATAGRAM	A connectionless, message-oriented socket.
OS_SocketType_STREAM	A stream-oriented socket with the concept of a connection.
OS_SocketType_MAX	Maximum.

Definition at line 69 of file osapi-sockets.h.

## 7.28 osal/src/os/inc/osapi-task.h File Reference

```
#include "osconfig.h"
#include "common_types.h"
```

#### **Data Structures**

struct OS\_task\_prop\_t
 OSAL task properties.

#### **Macros**

• #define OS MAX TASK PRIORITY 255

Upper limit for OSAL task priorities.

• #define OS FP ENABLED 1

Floating point enabled state for a task.

- #define OSAL PRIORITY C(X) ((osal priority t) {X})
- #define OSAL\_STACKPTR\_C(X) ((osal\_stackptr\_t) {X})
- #define OSAL TASK STACK ALLOCATE OSAL STACKPTR C(NULL)

## **Typedefs**

typedef uint8 t osal priority t

Type to be used for OSAL task priorities.

typedef void \* osal\_stackptr\_t

Type to be used for OSAL stack pointer.

typedef void osal\_task

For task entry point.

#### **Functions**

typedef osal\_task ((\*osal\_task\_entry)(void))

For task entry point.

 int32 OS\_TaskCreate (osal\_id\_t \*task\_id, const char \*task\_name, osal\_task\_entry function\_pointer, osal\_stackptr\_t stack\_pointer, size\_t stack\_size, osal\_priority\_t priority, uint32 flags)

Creates a task and starts running it.

int32 OS\_TaskDelete (osal\_id\_t task\_id)

Deletes the specified Task.

void OS\_TaskExit (void)

Exits the calling task.

int32 OS\_TaskInstallDeleteHandler (osal\_task\_entry function\_pointer)

Installs a handler for when the task is deleted.

int32 OS TaskDelay (uint32 millisecond)

Delay a task for specified amount of milliseconds.

int32 OS\_TaskSetPriority (osal\_id\_t task\_id, osal\_priority\_t new\_priority)

Sets the given task to a new priority.

osal id t OS TaskGetId (void)

Obtain the task id of the calling task.

int32 OS\_TaskGetIdByName (osal\_id\_t \*task\_id, const char \*task\_name)

Find an existing task ID by name.

int32 OS\_TaskGetInfo (osal\_id\_t task\_id, OS\_task\_prop\_t \*task\_prop)

Fill a property object buffer with details regarding the resource.

int32 OS\_TaskFindIdBySystemData (osal\_id\_t \*task\_id, const void \*sysdata, size\_t sysdata\_size)

Reverse-lookup the OSAL task ID from an operating system ID.

## 7.28.1 Detailed Description

Declarations and prototypes for task abstraction

## 7.28.2 Macro Definition Documentation

```
7.28.2.1 OS_FP_ENABLED #define OS_FP_ENABLED 1
```

Floating point enabled state for a task.

Definition at line 35 of file osapi-task.h.

Upper limit for OSAL task priorities.

Definition at line 32 of file osapi-task.h.

Definition at line 46 of file osapi-task.h.

Definition at line 53 of file osapi-task.h.

7.28.2.5 OSAL\_TASK\_STACK\_ALLOCATE #define OSAL\_TASK\_STACK\_ALLOCATE OSAL\_STACKPTR\_C (NULL)

Definition at line 54 of file osapi-task.h.

## 7.28.3 Typedef Documentation

## 7.28.3.1 osal\_priority\_t typedef uint8\_t osal\_priority\_t

Type to be used for OSAL task priorities.

OSAL priorities are in reverse order, and range from 0 (highest; will preempt all other tasks) to 255 (lowest; will not preempt any other task).

Definition at line 44 of file osapi-task.h.

```
7.28.3.2 osal_stackptr_t typedef void* osal_stackptr_t
```

Type to be used for OSAL stack pointer.

Definition at line 51 of file osapi-task.h.

```
7.28.3.3 osal_task typedef void osal_task
```

For task entry point.

Definition at line 68 of file osapi-task.h.

## 7.28.4 Function Documentation

For task entry point.

## 7.29 osal/src/os/inc/osapi-timebase.h File Reference

```
#include "osconfig.h"
#include "common_types.h"
```

#### **Data Structures**

• struct OS\_timebase\_prop\_t

Time base properties.

## **Typedefs**

typedef uint32(\* OS\_TimerSync\_t) (osal\_id\_t timer\_id)
 Timer sync.

#### **Functions**

Create an abstract Time Base resource.

• int32 OS\_TimeBaseSet (osal\_id\_t timebase\_id, uint32 start\_time, uint32 interval\_time)

Sets the tick period for simulated time base objects.

int32 OS\_TimeBaseDelete (osal\_id\_t timebase\_id)

Deletes a time base object.

• int32 OS\_TimeBaseGetIdByName (osal\_id\_t \*timebase\_id, const char \*timebase\_name)

Find the ID of an existing time base resource.

• int32 OS\_TimeBaseGetInfo (osal\_id\_t timebase\_id, OS\_timebase\_prop\_t \*timebase\_prop)

Obtain information about a timebase resource.

• int32 OS\_TimeBaseGetFreeRun (osal\_id\_t timebase\_id, uint32 \*freerun\_val)

Read the value of the timebase free run counter.

## 7.29.1 Detailed Description

Declarations and prototypes for timebase abstraction

## 7.29.2 Typedef Documentation

```
\textbf{7.29.2.1} \quad \textbf{OS\_TimerSync\_t} \quad \texttt{typedef uint32} \ (* \ \texttt{OS\_TimerSync\_t}) \quad (\texttt{osal\_id\_t timer\_id})
```

Timer sync.

Definition at line 34 of file osapi-timebase.h.

## 7.30 osal/src/os/inc/osapi-timer.h File Reference

```
#include "osconfig.h"
#include "common_types.h"
```

## **Data Structures**

• struct OS\_timer\_prop\_t

Timer properties.

## **Typedefs**

typedef void(\* OS\_TimerCallback\_t) (osal\_id\_t timer\_id)
 Timer callback.

#### **Functions**

int32 OS\_TimerCreate (osal\_id\_t \*timer\_id, const char \*timer\_name, uint32 \*clock\_accuracy, OS\_TimerCallback\_t callback\_ptr)

Create a timer object.

int32 OS\_TimerAdd (osal\_id\_t \*timer\_id, const char \*timer\_name, osal\_id\_t timebase\_id, OS\_ArgCallback\_t callback ptr, void \*callback arg)

Add a timer object based on an existing TimeBase resource.

int32 OS\_TimerSet (osal\_id\_t timer\_id, uint32 start\_time, uint32 interval\_time)

Configures a periodic or one shot timer.

• int32 OS\_TimerDelete (osal\_id\_t timer\_id)

Deletes a timer resource.

int32 OS\_TimerGetIdByName (osal\_id\_t \*timer\_id, const char \*timer\_name)

Locate an existing timer resource by name.

• int32 OS\_TimerGetInfo (osal\_id\_t timer\_id, OS\_timer\_prop\_t \*timer\_prop)

Gets information about an existing timer.

## 7.30.1 Detailed Description

Declarations and prototypes for timer abstraction (app callbacks)

## 7.30.2 Typedef Documentation

```
7.30.2.1 OS_TimerCallback_t typedef void(* OS_TimerCallback_t) (osal_id_t timer_id)
```

Timer callback.

Definition at line 34 of file osapi-timer.h.

## 7.31 osal/src/os/inc/osapi-version.h File Reference

```
#include "common_types.h"
```

#### **Macros**

- #define OS\_BUILD\_NUMBER 235
- #define OS BUILD BASELINE "v6.0.0-rc4"
- #define OS\_MAJOR\_VERSION 5

Major version number.

• #define OS MINOR VERSION 0

Minor version number.

#define OS REVISION 99

Revision version number. Value of 99 indicates a development version.

#define OS MISSION REV 0xFF

Mission revision.

#define OS\_STR\_HELPER(x) #x

Helper function to concatenate strings from integer.

#define OS\_STR(x) OS\_STR\_HELPER(x)

Helper function to concatenate strings from integer.

• #define OS\_VERSION OS\_BUILD\_BASELINE "+dev" OS\_STR(OS\_BUILD\_NUMBER)

Development Build Version Number.

• #define OS\_VERSION\_CODENAME "Draco"

Version code name All modular components which are tested/validated together should share the same code name.

• #define OS\_VERSION\_STRING

Development Build Version String.

 #define OSAL\_API\_VERSION ((OS\_MAJOR\_VERSION \* 10000) + (OS\_MINOR\_VERSION \* 100) + OS\_REVISION)

Combines the revision components into a single value.

#### **Functions**

- const char \* OS GetVersionString (void)
- const char \* OS\_GetVersionCodeName (void)
- void OS GetVersionNumber (uint8 VersionNumbers[4])

Obtain the OSAL numeric version number.

uint32 OS\_GetBuildNumber (void)

Obtain the OSAL library numeric build number.

## 7.31.1 Detailed Description

Provide version identifiers for Operating System Abstraction Layer

## Note

OSAL follows the same version semantics as cFS, which in turn is based on the Semantic Versioning 2.0 Specification. For more information, see the documentation provided with cFE.

## 7.31.2 Macro Definition Documentation

7.31.2.1 OS\_BUILD\_BASELINE #define OS\_BUILD\_BASELINE "v6.0.0-rc4"

Definition at line 38 of file osapi-version.h.

7.31.2.2 OS\_BUILD\_NUMBER #define OS\_BUILD\_NUMBER 235

Definition at line 37 of file osapi-version.h.

7.31.2.3 OS\_MAJOR\_VERSION #define OS\_MAJOR\_VERSION 5

Major version number.

Definition at line 43 of file osapi-version.h.

7.31.2.4 OS\_MINOR\_VERSION #define OS\_MINOR\_VERSION 0

Minor version number.

Definition at line 44 of file osapi-version.h.

7.31.2.5 OS\_MISSION\_REV #define OS\_MISSION\_REV 0xFF

Mission revision.

Reserved for mission use to denote patches/customizations as needed. Values 1-254 are reserved for mission use to denote patches/customizations as needed. NOTE: Reserving 0 and 0xFF for cFS open-source development use (pending resolution of nasa/cFS#440)

Definition at line 54 of file osapi-version.h.

```
7.31.2.6 OS_REVISION #define OS_REVISION 99
```

Revision version number. Value of 99 indicates a development version.

Definition at line 45 of file osapi-version.h.

Helper function to concatenate strings from integer.

Definition at line 60 of file osapi-version.h.

```
7.31.2.8 OS_STR_HELPER #define OS_STR_HELPER( x ) #x
```

Helper function to concatenate strings from integer.

Definition at line 59 of file osapi-version.h.

```
7.31.2.9 OS VERSION #define OS_VERSION OS_BUILD_BASELINE "+dev" OS_STR(OS_BUILD_NUMBER)
```

Development Build Version Number.

Baseline git tag + Number of commits since baseline.

Definition at line 65 of file osapi-version.h.

```
7.31.2.10 OS_VERSION_CODENAME #define OS_VERSION_CODENAME "Draco"
```

Version code name All modular components which are tested/validated together should share the same code name.

Definition at line 70 of file osapi-version.h.

## 7.31.2.11 OS\_VERSION\_STRING #define OS\_VERSION\_STRING

#### Value:

```
" OSAL Development Build\n" \
" " OS_VERSION " (Codename: " OS_VERSION_CODENAME ")\n" /* Codename for current development */ \
" Latest Official Version: osal v5.0.0" /* For full support please use official release version */
```

Development Build Version String.

Reports the current development build's baseline, number, and name. Also includes a note about the latest official version.

Definition at line 76 of file osapi-version.h.

```
7.31.2.12 OSAL_API_VERSION #define OSAL_API_VERSION ((OS_MAJOR_VERSION * 10000) + (OS_MINOR_VERSION * 100) + OS_REVISION)
```

Combines the revision components into a single value.

Applications can check against this number e.g. "#if OSAL\_API\_VERSION >= 40100" would check if some feature added in OSAL 4.1 is present.

Definition at line 86 of file osapi-version.h.

## 7.31.3 Function Documentation

```
7.31.3.1 OS_GetBuildNumber() uint32 OS_GetBuildNumber ( void )
```

Obtain the OSAL library numeric build number.

The build number is a monotonically increasing number that (coarsely) reflects the number of commits/changes that have been merged since the epoch release. During development cycles this number should increase after each subsequent merge/modification.

Like other version information, this is a fixed number assigned at compile time.

#### Returns

The OSAL library build number

```
7.31.3.2 OS_GetVersionCodeName() const char* OS_GetVersionCodeName ( void )
```

Gets the OSAL version code name

All NASA CFE/CFS components (including CFE framework, OSAL and PSP) that work together will share the same code name.

#### Returns

OSAL code name. This is a fixed value string and is never NULL.

```
7.31.3.3 OS_GetVersionNumber() void OS_GetVersionNumber ( uint8 VersionNumbers[4] )
```

Obtain the OSAL numeric version number.

This retrieves the numeric OSAL version identifier as an array of 4 uint8 values.

The array of numeric values is in order of precedence: [0] = Major Number [1] = Minor Number [2] = Revision Number [3] = Mission Revision

The "Mission Revision" (last output) also indicates whether this is an official release, a patched release, or a development version. 0 indicates an official release 1-254 local patch level (reserved for mission use) 255 indicates a development build

#### **Parameters**

	out	VersionNumbers	A fixed-size array to be filled with the version numbers	
--	-----	----------------	--	--

Gets the OSAL version/baseline ID as a string

This returns the content of the OS\_VERSION macro defined above, and is specifically just the baseline and development build ID (if applicable), without any extra info.

#### Returns

Basic version identifier. This is a fixed value string and is never NULL.

## 7.32 osal/src/os/inc/osapi.h File Reference
